# BOREAS Experiment Plan

# **Appendices A – P** Miscellaneous Project Information

May 1994

Version 3.0

#### TABLE OF CONTENTS BOREAS EXPERIMENT PLAN

- 0.0 Executive Summary
- 1.0 Science Background, Objectives
  - 1.1 Scientific Issues
  - 1.2 Objectives
  - 1.3 References
- 2.0 Experiment Design and Project Organization
  - 2.1 Overview of Approach
    - 2.1.1 Multiscale Strategy
      - 2.1.1.1 Hierarchy of Spatial Scales
      - 2.1.1.2 Study Area Locations and Mesometerological Network
    - 2.1.2 Duration and Timing of Field Operations
  - 2.2 Study Areas and Tower Flux Sites
    - 2.2.1 Sampling Strategy
    - 2.2.2 Study Areas
      - 2.2.2.1 Northern Study Area (Thompson, Manitoba)
      - 2.2.2.2 Southern Study Area (Prince Albert, Saskatchewan)
    - 2.2.3 Tower Flux Sites
      - 2.2.3.1 Northern Study Area Tower Flux Sites
      - 2.2.3.2 Southern Study Area Tower Flux Sites
  - 2.3 Project Organization
    - 2.3.1 The BOREAS Coordinating Committee (BCC)
    - 2.3.2 The BOREAS Executive (BEX)
    - 2.3.3 The Science Teams
    - 2.3.4 Staff Science and Support
  - 2.4 Overview of Project Resources
- 3.0 Staff Support
  - 3.1 Overview of Staff Support
  - 3.2 Staff Monitoring Program
    - 3.2.1 Automatic Meteorological Stations (AMS)
      - 3.2.1.1 AES Surface
    - 3.2.2 Upper Air Network
      - 3.2.2.1 ECMWF Operational Products for BOREAS
      - 3.2.2.2 Products for BOREAS
    - 3.2.3 Hydrology, Snow and Soil Properties
      - 3.2.3.1 Hydrology
      - 3.2.3.2 Snow Measurements

- 3.2.3.3 Soil Survey and Characterization
- 3.2.3.4 Soil Moisture, Temperature and Soil Properties
- 3.2.4 Auxiliary Site Work
  - 3.2.4.1 Approach
  - 3.2.4.2 Requirements
  - 3.2.4.3 Stratification
  - 3.2.4.4 Site Selection
  - 3.2.4.5 Measurements
    - 3.2.4.5.1 Tower flux annex sites
    - 3.2.4.5.2 Carbon budget modeling sites
    - 3.2.4.5.3 Radiative transfer study sites
    - 3.2.4.5.4 Carbon model evaluation sites
    - 3.2.4.5.5 Intensive allometry sites
    - 3.2.4.5.6 Remote sensing/modeling study sites
  - 3.2.4.6 Hemispherical Photography
  - 3.2.4.7 Soil sampling at the auxiliary sites
  - 3.2.4.8 Schedule
- 3.2.5 Radiometric Calibration
  - 3.2.5.1 Aircraft and Remote Sensing Instrumentation
    - 3.2.5.1.1 Radiometric Scale Realization
    - 3.2.5.1.2 On Site Radiometric and Spectral Calibration Sources
    - 3.2.5.1.3 Diffuse Reflectance Reference Panels
    - 3.2.5.1.4 In-Flight Calibration and Comparison

of Aircraft Instrumentation (R. Green, NASA/JPL)

- 3.2.5.2 Satellite Sensors
- 3.2.6 Standard Gasses and Gas Calibration
- 3.2.7 BOREAS Thermal Radiance Measurement Intercomparison Plan
- 3.2.8 Global Positioning System (GPS)
- 3.3 Satellite and Airborne Remote Sensing
  - 3.3.1 Satellite Image Data Plan
    - 3.3.1.1 Landsat and SPOT
    - 3.3.1.2 AVHRR-LAC
    - 3.3.1.3 ERS-1
    - 3.3.1.4 GOES
    - 3.3.1.5 JERS-1
    - 3.3.1.6 SIR-C/X-SAR
  - 3.3.2 Airborne Sensor Data Plan
    - 3.3.2.1 C-130/MAS; Staff (Ungar)
      - 3.3.2.2 C-130/ASAS; RSS-2 (Irons)
      - 3.3.2.3 C-130/NS001-TMS, Staff (Angelici)
      - 3.3.2.4 C-130/ATSP; RSS-12 (Wrigley)
      - 3.3.2.5 CV-580/SAR; RSS (Ranson); Staff-CCRS (Cihlar/Hawkins)
      - 3.3.2.6 DC-8/AIRSAR; RSS-16 (Saatchi)

- 3.3.2.7 Twin Otter/AMMR; HYD-2 (Chang)
- 3.3.2.8 ER-2/AVIRIS; RSS-18 (Green)
- 3.3.2.9 ER-2/Airborne Ocean Color Imager/TE-15 (Bukata)
- 3.3.2.10 ER-2/MAS; Staff (Ungar, D.K. Hall), Modland
  - 3.3.2.11 Piper Chieftain/CASI; RSS-19 (Miller)
  - 3.3.2.12 DC-3/MEIS II; Staff-CCRS (Gauthier)/RSS-7 (Chen)
  - 3.3.2.13 Helicopter/C-band Scat; Staff (Gogineni)
  - 3.3.2.14 Helicopter/SE-590; RSS-3 (Walthall), TE-18 (Hall)
  - 3.3.2.15 Aerocommander/Gamma Radiation: HYD-6 (Peck) HYD-4 (Goodison)
- 3.4 Site Logistics and Infrastructure
  - 3.4.1 Infrastructure for Tower Flux Sites
    - 3.4.2 Laboratory Facilities
- 3.5 The BOREAS Information System (BORIS)
  - 3.5.1 Role of BORIS
  - 3.5.2 The BORIS Working Group
  - 3.5.3 General Policies
    - 3.5.3.1 Data Policy
      - 3.5.3.2 Data Documentation
      - 3.5.3.3 Data Quality Assurance
      - 3.5.3.4 Data Plans
        - 3.5.3.4.1 Proposed AFM Data Plan
        - 3.5.3.4.2 Proposed TF Data Plan
        - 3.5.3.4.3 Proposed TE Data Plan
        - 3.5.3.4.4 Proposed TGB Data Plan
        - 3.5.3.4.5 Proposed HYD Data Plan
        - 3.5.3.4.6 Proposed RSS Data Plan
      - 3.5.3.5 Data Delivery
      - 3.5.3.6 Data Standards
  - 3.5.4 Mapping and Site Location
    - 3.5.4.1 BORIS Grid
    - 3.5.4.2 BOREAS Operational Grid
  - 3.5.5 Gridded Data Products
  - 3.5.6 Data Access
  - 3.5.7 Satellite Image Data Products
  - 3.5.8 BOREAS Data Documentation Outline
- 4.0 Science Teams
  - 4.1 Airborne Flux and Meteorology (AFM)
    - 4.1.1 Objectives
    - 4.1.2 Investigation Summaries
    - 4.1.3 Field Measurements
      - 4.1.3.1 In-Situ Measurements
        - 4.1.3.1.1 Overview
        - 4.1.3.1.2 Strategies and priorities of aircraft flux

#### measurements

- 4.1.3.1.3 Aircraft-tower comparisons
- 4.1.3.1.4 Role and effects of lakes
- 4.1.3.1.5 Possible impacts of abrupt land-use and land-cover boundaries
- 4.1.3.1.6 Importance of modeling studies
- 4.1.3.1.7 Footprints and intrasite variability
- 4.1.3.1.8 Candle Lake Modelling and Measurement
- 4.1.3.2 Data to be submitted to BORIS
- 4.1.3.3 Special Concerns of AFM Field and Modeling
- Investigations
- 4.1.4 Supporting Measurements
  - 4.1.4.1 Needs from other groups
  - 4.1.4.2 Support and staff science needs identified by AFM
- 4.1.5 Internal Organization
- 4.2 Tower Flux (TF)
  - 4.2.1 Objectives
  - 4.2.2 Investigation Summaries
  - 4.2.3 Field Measurements
    - 4.2.3.1 In-Situ Measurements
    - 4.2.3.2 Data to be submitted to BORIS
  - 4.2.4 Supporting Measurements
    - 4.2.4.1 Needs from other groups
    - 4.2.4.2 Needs from staff science
  - 4.2.5 Next Steps
    - 4.2.5.1 1993 and 1994 Activities
    - 4.2.5.2 TF Internal Organization
- 4.3 Terrestrial Ecology (TE)
  - 4.3.1 Objectives
  - 4.3.2 Investigation Summaries
  - 4.3.3 Field Measurements
    - 4.3.3.1 In-Situ Measurements
    - 4.3.3.2 Biometry Measurements
      - 4.3.3.2.1 Biometry Work Plan
      - 4.3.3.2.2 Allometry Measurements
      - 4.3.3.2.3 Aboveground Biomass and Net Primary Production
      - 4.3.3.2.4 Biometry and Allometry Measurements to be made at auxiliary sites
    - 4.3.3.3 Canopy Access and Destructive Sampling Needs
      - 4.3.3.3.1 Canopy Access
      - 4.3.3.3.2 Destructive Sampling Needs
    - 4.3.3.4 TE Investigators' Field Visits Schedules
  - 4.3.4 Experiment Protocols
    - 4.3.4.1 Soil CO<sub>2</sub> flux measurements at BOREAS

- 4.3.4.2 Procedures for measuring and reporting foliage area
- 4.3.5 TE Modelling, Scaling and Links to RS
  - 4.3.5.1 Comparison between models and tower fluxes
  - 4.3.5.2 The auxiliary sites: testing light use efficiency models and forest-BGC
  - 4.3.5.3 Landscape fluxes
  - 4.3.5.4 Regional fluxes
  - 4.3.5.5 Mixed stand
  - 4.3.5.6 Working group
- 4.3.6 Internal Organization
- 4.4 Trace Gas Biogeochemistry (TGB)
  - 4.4.1 Objectives
  - 4.4.2 Investigation Summaries
  - 4.4.3 Field Measurements
    - 4.4.3.1 In-Situ Measurements
    - 4.4.3.2 Data to be submitted to BORIS
  - 4.4.4 Supporting Measurements
    - 4.4.4.1 Needs from other groups
    - 4.4.4.2 Needs from staff science
    - 4.4.4.3 Minimal Ancillary Field Measurements to Accompany Flux Measurements
  - 4.4.5 Internal Organization
- 4.5 Hydrology (HYD)
  - 4.5.1 Objectives
  - 4.5.2 Project Summaries
  - 4.5.3 Field Measurements
    - 4.5.3.1 In-Situ Measurements
      - 4.5.3.1.1 Overview
      - 4.5.3.1.2 Summary of Project Data Collection Plans
      - 4.5.3.1.3 Study Gaps
    - 4.5.3.2 Data to be submitted to BORIS
  - 4.5.4 Supporting Measurements
    - 4.5.4.1 Needs from Other Groups or Core Measurements
    - 4.5.4.2 Additional Core Data Collection Needs
  - 4.5.5 Coordination and Other Issues
    - 4.5.5.1 1993 Activities
    - 4.5.5.2 Coordination with other groups
    - 4.5.5.3 Interdisciplinary Working Groups
- 4.6 Remote Sensing Science (RSS)
  - 4.6.1 Objectives
  - 4.6.2 Investigation Summaries
  - 4.6.3 Field and Aircraft Measurements
    - 4.6.3.1 Summary of Parameters to be Measured
    - 4.6.3.2 TE/RSS Gridded Parameter and Modeling Initiative
    - 4.6.3.3 Data to be Submitted to BORIS (Deliverables)
  - 4.6.4 Supporting Measurements

- 4.6.4.1 RSS Group Data Needs
- 4.6.4.2 RSS Group Infrastructure Needs
- 4.6.5 Next Steps
  - 4.6.5.1 1993 Activities
  - 4.6.5.2 Internal Organization
- 5.0 Experiment Execution
  - 5.1 Management of Experiment Operations
    - 5.1.1 Overview
    - 5.1.2 Decision Making
    - 5.1.3 Operations Management Roles and Responsibilities
      - 5.1.3.1 BOREAS Mission Manager (MM)
      - 5.1.3.2 Study Area Manager (SĂM)
      - 5.1.3.3 Team Chairs/Representatives
      - 5.1.3.4 TF and TE Site Captains
      - 5.1.3.5 Field Liaison and Site Managers/Contacts
      - 5.1.3.6 Laboratory Chiefs
      - 5.1.3.7 Aircraft Managers
      - 5.1.3.8 Investigators
      - 5.1.3.9 Meteorological Forecaster
    - 5.1.4 Meeting Schedules and Formats
    - 5.1.5 Aircraft Operations Protocols
    - 5.1.6 Communications
      - 5.1.6.1 Aircraft Radio Net
      - 5.1.6.2 Ground Radio Net
      - 5.1.6.3 Telephone/Faxes
    - 5.1.7 Emergency Procedures and Safety
      - 5.1.7.1 Emergency Procedures
      - 5.1.7.2 Safety
  - 5.2 Mission Plans
    - 5.2.1 Individual Aircraft Mission Plans
    - 5.2.1c Reference Table for Decoding BOREAS Aircraft Mission Identifiers
      - 5.2.1.1 C-130 (RC)
        - 5.2.1.1.1 RC-SN and RC-SS Snow Mission in FFC-T
        - 5.2.1.1.2 RC-TN and RC-TS: ASAS, POLDER, TMS Mission Over TF Sites
        - 5.2.1.1.3 RC-MN and RC-MS: NSA and SSA Mapping: TMS, POLDER, MAS
        - 5.2.1.1.4 RC-RT: Regional Transect; TMS, MAS
      - 5.2.1.2 DC-8 (RD)
      - 5.2.1.3 CV-580 (RV)
      - 5.2.1.4 DH-6 (RT)
        - 5.2.1.4.1 RT-SN: Snow Microwave, NSA
        - 5.2.1.4.2 RT-ST: Snow Microwave, Transect
        - 5.2.1.4.3 RT-SS: Snow Microwave, SSA
      - 5.2.1.5 ER-2 (RE)
        - 5.2.1.5.1 RE-US: ER-2 MAS Snow Survey, SSA

- 5.2.1.5.2 RE-MS: Mapping of SSA
- 5.2.1.5.3 RE-MN: Mapping of NSA, Transect
- 5.2.1.5.4 RE-SS: Snow over flights of SSA during single pass AVIRIS
- 5.2.1.5.5 RE-SN: Snow over flights of NSA during FFC-T
- 5.2.1.6 Chieftain (RP)
  - 5.2.1.6.1 RP-TS: Tower/auxiliary sites, SSA
  - 5.2.1.6.2 RP-TN: Tower/auxiliary sites, NSA
  - 5.2.1.6.3 RP-SS Snow lines, SSA
  - 5.2.1.6.4 RP-SN: Snow lines, NSA
  - 5.2.1.6.5 RP-RT: Coverage of regional transect
- 5.2.1.7 DC-3 (RF)
  - 5.2.1.7.1 RF-TS: TF sites in SSA
  - 5.2.1.7.2 RF-TN: TF sites in NSA
- 5.2.1.8 Aerocommander (RA)
  - 5.2.1.8.1 RA-SN: Snow Survey, NSA
  - 5.2.1.8.2 RA-ST: Snow Survey, Transect
  - 5.2.1.8.3 RA-SS: Snow Survey, SSA
  - 5.2.1.8.4 RA-WT: Soil Moisture Survey, Transect
  - 5.2.1.8.5 RA-WS: Soil Moisture Survey, SSA
- 5.2.1.9 NASA Helicopter (RH)
  - 5.2.1.9.1 RH-TS or RH-TN: Passive Optical Mission (3 hours)
  - 5.2.1.9.2 RH-BS or RH-BN: Microwave Scatterometer Data Collection (3 hours)
- 5.2.1.10 Flight Plans for Flux Aircraft Operations in 1994 IFCs
  - 5.2.1.10.1 Fx-CL: Candle Lake Runs
  - 5.2.1.10.2 Fx-TS, Fx-TN: Site-Specific, Short Passes
  - 5.2.1.10.3 FE-RT: Electra Transects
  - 5.2.1.10.4 Fx-MS, Fx-MN: Mini-/Meso-Scale Transects and L-shaped patterns
  - 5.2.1.10.5 Fx-GS, Fx-GN: Grid and Stack
  - 5.2.1.10.6 Fx-PS, Fx-PN: Budget Box
  - 5.2.1.10.7 Fx-HS, Fx-HN: Stacks and Tees
  - 5.2.1.10.8 Fx-FS, Fx-FN: Flights-of-Two
  - 5.2.1.10.9 Fx-ZS: Low Level Routes
- 5.2.2 Mission Strategies
- 5.2.3 Flight Hours and Basing
- 5.2.4 Satellite Schedule
- 5.3 Experiment Operations
  - 5.3.1 IFC-93
  - 5.3.2 FFC-W
  - 5.3.3 FFC-T
  - 5.3.4 IFC-1
  - 5.3.5 IFC-2
  - 5.3.6 IFC-3

#### **APPENDICES**

Appendix A: Appendix B:	Investigator and Staff Addresses BOREAS Emergency Procedures and Guidelines for SSA and NSA
Appendix C:	BOREAS Check-In/Check-Out Procedures
Appendix D:	BOREAS Inter-IFC Survival Guides
Appendix E:	Customs and Shipping Information, Immigration
	Formalities, Shipping Destinations, Importation of
	Plant and Soil Samples
Appendix F:	Agreement between United States and Canada
Appendix G:	Accommodations
Appendix H:	BOREAS Guidelines for the Conduct of Investigators in
	the Field for NSA and SSA
Appendix I:	BOREAS Auxiliary Site Directions
Appendix J:	BOREAS Modeling Contributions
Appendix K:	Measurement Methodologies
Appendix L:	AES Surface Weather Stations
Appendix M:	Traditional Land Use Map and Calendar
Appendix N:	Investigation Profile
Appendix O:	Satellite Overpass Schedule
Appendix P:	Acronyms

#### Appendix B: BOREAS Emergency Procedures and Guidelines for SSA and NSA

#### **BOREAS EMERGENCY PROCEDURES - Northern Study Area (NSA)**

The areas covered in this guide are:

- 1. **MEDEVAC**; instructions on procedures for contacting emergency services and guiding them to the site.
- 2. **RADIO-PHONE LINK**; how to connect to the telephone system using your hand-held radio.
- 3. **OTHER NUMBERS**; Towing, hospitals, etc.

### 1. MEDEVAC

#### A COPY OF THIS PACKAGE IS WITH THOMPSON EMERGENCY SERVICES

Call BOREAS Operations and give location and other details. If you cannot contact BOREAS Operations, use your radio to make an emergency phone call, (see section 2).

Most of the BOREAS NSA sites are off Route 391. Three sites are close to Route 391 for helicopter or road ambulance pickup; one is some distance from the road (old black spruce) and has direct helicopter access. Details of road and trail access are provided below.

Milepost distances are provided for road access to the Tower Flux sites in the table below. **Site entrances are marked by 4"x4" posts about 7' tall and are clearly visible from Rt. 391**. The marker posts are bright green, with orange stripes at the top, and an identifying number. The number reflects mile posts distance, in kilometers from Thompson.

VOR/DME (aviation navigational aid) numbers are provided for helicopter access. Note that the "road access" VOR/DME co-ordinates correspond to the milepost locations.

SITE NAME	SITE POSITION VOR-DME	ROAD ACCESS VOR-DME	MARKER POSTS (km)	
Young Jack Pine-YJP	280-16.5	281-16.3	38.9	1
Fen-Fen	280-21.1	281-21.2	47.6	2
Old Black Spruce-OBS	270-22.6	276-23.4	52.9	3
Old Jack Pine-OJP	278-28.6	278-27.6	61.6	4

#### MISSION MANAGER RESPONSE TO A BOREAS CALL FOR MEDEVAC

- (1) Determine whether the medevac can be done by road ambulance or Helicopter.
- (2) If road ambulance, call Thompson emergency services at 677-7911 and direct dispatcher to the site. The service has a copy of a map of the NSA and instructions on how to get to the Tower Flux (TF) sites.
- (3) If a helicopter is required, call the Thompson emergency services number anyway so they can ready a trauma team if necessary. Ask them where and when the helicopter should pick up the trauma team. Tell them that you will then try to get a helicopter from Canadian Helicopters or Custom Helicopters. Then call:

Canadian Helicopters:	778-5049, 778-5962 office hours
Custom Helicopters:	778,8991, 778-7196 otherwise 677-3720, 677-9525 office hours
I	677-3566, 778-7745, 677-9731 otherwise

Tell them:

- (a) Where the patient is to be picked up, give site name and VOR/DME coordinates. The best helo pick-up points are the road access for YJP, FEN and OJP. The on-site pad is best for OBS. The VOR/DME coordinates for these best pickup points are marked in bold above.
- (b) Where to pick up the trauma team if they are available.
- (c) Where to pick up a BOREAS guide if necessary (i.e. at BOREAS-Study Area Headquarters (SAHQ) in Keewatin Air).

Payment details are to be worked out after the medevac. No committments can be made by the Mission Manager (MM) or Study Area Manager (SAM) for a given individual. It all depends on insurance, nationality, etc. Don't worry, they will get paid.

#### 2. RADIO-PHONE LINK

You can use your radio to make an emergency call:

- Select Channel 3
- Hold key down, transmit for 5 seconds.
- Manitoba Tel Operator will come on line. If operator does not come on line, then remove the antenna from your radio and hook into the tree antenna that is located on all Northern Flux Tower sites. If you are not at a flux site, then walk to an area of higher elevation, or climb a tree, tower, hut, or vehicle and retransmit. Operator will ask for registry and code number.
- Respond: Prince Albert Registry, code number JW2 9062.
- Give operator the number you want to call (Thompson Emergency Services is 677-7911)

į	3.	OTHER NUMBERS
I I a an ital		
Hospital Towing		677-2381 778-8290
Weather Office		677-4969

#### BOREAS EMERGENCY PROCEDURES - Southern Study Area (SSA)

The areas covered in this guide are:

- 1. **MEDEVAC**; instructions on procedures for contacting emergency services and guiding them to the site.
- 2. **RADIO-PHONE LINK**; how to connect to the telephone system using your hand-held radio.
- 3. Emergency radio monitoring.
- 4. **OTHER NUMBERS**; Towing, hospitals, etc.

#### A COPY OF THIS PACKAGE IS WITH PRINCE ALBERT EMERGENCY SERVICES

Call BOREAS Study Area Headquarters (SAHQ) and give location and other details. If you cannot contact BOREAS SAHQ, use your radio to make an emergency phone call, (see section 2 on next page).

There are five principal BOREAS sites to the north of Prince Albert, each of which has a tower structure, instrument huts and trail access from the nearest road. One site (Old Aspen - OA) is in the Southern end of Prince Albert National Park and the other four (Old Jack Pine - OJP; Young Jack Pine - YJP; Fen - Fen; Old Black Spruce - OBS) are located in the Candle Lake area. All of the sites have helicopter access and the Candle Lake sites are all located close to roads. Details of road and trail access are provided in the attachment.

Site entrances from the roads are marked by 4"x4" posts about 7' tall and are clearly visible from the road. The posts are bright green, with orange stripes at the top and an identifying number.

VOR/DME (aviation navigational aid) numbers are provided for helicopter access. Note that the "road access" VOR/DME co-ordinates correspond to the road trail junctions referred to in the package.

SITE NAME	SITE POSITION	ROAD ACCESS
	VOR-DME	VOR-DME
Old Aspen - OA	308-31	303-29
Fen - Fen	032-52	033-52
Young Jack Pine - YJP	031-54	031-55
Old Jack Pine - OJP	028-55	029-56
Old Black Spruce - OBS	011-50	010-51

#### MISSION MANAGER RESPONSE TO A BOREAS CALL FOR MEDEVAC

- (1) Determine whether the medevac can be done by road ambulance or Helo. (The OA site has a very long access trail so ambulance access may be impractical. There is a clearing just to the east of the OA - tower for Helo access. The Candle Lake sites are more easy to access by road but are roughly one hours drive from Prince Albert).
- (2) If road ambulance, call Prince Albert emergency services, 764-6455 and direct dispatcher to the site. The service has a copy of a map of the SSA and instructions on how to get to the TF sites.
- (3) If Helo is required, call the Prince Albert Emergency number (764-6455) anyway so they can ready a trauma team if necessary. Ask them where and when the Helo should pick up the trauma team. Tell them that you will then try to get a helicopter from Athabaska Airways. Then call Athabaska Airways, 764-1404. If there is no immediate answer wait for the taped message which will give the emergency (overnight) number.

Tell them:

- (a) Where the patient is to be picked up, give site name and VOR/DME coordinates. The best helo pick-up points are the road access for YJP, FEN and OBS and in clearings to the east of OJP and OA.
- (b) Where to pick up the trauma team if they are available.
- (c) Where to pick up a BOREAS guide if necessary (at SAHQ in Candle Lake.

Payment details are to be worked out after the medevac. No committments can be made by the Mission Manager (MM) or Study Area Manager (SAM) for a given individual. It all depends on insurance, nationality, etc. Don't worry, they will get paid.

2. RADIO-PHONE LINK

You can use your radio to make an emergency call: NOTE: Coverage is limited; see diagram:

• Select Sasktel channel

3 if in the Prince Albert National Park (PANP)

- 11or 13 if in Candle Lake or White Gull Basin Area.
- Hold key down, transmit for 5 seconds.
- Operator will come on line and will ask for registry and code number.
- Respond: Prince Albert Registry, code JW2 9062.
- Give operator number (P.A. Emergency Services is 764-6455)

#### 3. EMERGENCY RADIO MONITORING

The radio is monitored 24 hours a day by the Radio Branch in Prince Albert and by the Fire Management Control Center during the daylighted hours. If you are out of telephone range or the BOREAS Operations is not responding, you may call out for emergency help until one of the above agencies responds. The Radio Branch has a copy of the BOREAS Tower Flux sites and can assist you in getting emergency help.

#### 4. OTHER NUMBERS

Hospitals Towing (Candle Lake)

764-1551, 922-2605 929-4662 (W) 929-3149 (H)

## **Appendix C: BOREAS Check-In/Check-Out Procedures**

#### **BOREAS IFC Initial Check-in/Check-out and Registration**:

On arrival to the northern or southern study areas, please report to the Study Area Headquarters (SAHQ) for registration. The registration process will consist of the following and should take no more than 30 minutes.

1) Please provide the operations center with the following information for each person :

Name Team number Description of vehicle and licence plate number Name of place where staying : local telephone number and room number Date of anticipated departure Work address Contact name and number - in case of emergency

Note : It is the responsibility of the team leader that all participants within his/her group be registered with the SAHQ.

2) Pick-up an updated copy of emergency procedures.

3) Pick-up a copy of BOREAS daily check-in/Check-out procedures and final check-out procedures.

4) Pick-up a copy of updated telephone lists of general BOREAS numbers as well as a listing of current BOREAS participants.

5) Check-out a ground radio (generally the team leader will do this) - staff will provide instructions on operation if needed.

6) Check-out any needed keys.

As part of the registration procedure, BOREAS staff will also show investigators the facilities of the SAHQ(location of the fax machine, computers, copiers, telephones, etc ....).

The operations center will generally be open from 8:00 AM to 6:00 PM- local time during the IFCs.

#### **BOREAS Daily Check-in/Check-out :**

This daily process is necessary for two reasons. In case of an emergency (fire, storm, medical, mechanical, etc...), BOREAS staff needs to know where everyone is and secondly if someone is trying to contact you, we need to know where you are to complete a successful exchange of information.

1) Turn on radio before leaving or enroute for the field in the morning and contact the SAHQ. Transmit the following information : name, group, (names of participants within your group, vehicle description; if different from initial registration at SAHQ), destination and expected arrival back to your accommodations.

2) Keep your radio on: Radio checks will be made throughout the day by the SAHQ.

3) If your team moves from one destination to another during the day, inform the SAHQ.

4) Radio or telephone in by 2 PM local time your plans for the next day. This information will be used at the nightly BOG meeting. If you want to work at PANP the next day, be sure to inform the SAM.

5) Please contact the SAHQ when you leave the study area en route for town/accomodations either by radio or telephone.

6) Unaccounted personnel at the end of the day will require the study area manager (SAM) to organize a search.

7) There will be time-coincident nightly meetings at both SAHQs - (8PM : southern and 9PM : northern) providing a synoptic weather discussion and forecast, brief updates of team activities of the day , planned team activities for the following day and a mission managers report of general BOREAS items.

#### **BOREAS IFC Check-Out Procedure** :

All registered personnel should go through a check-out procedure at the SAHQ. If this is not possible, please telephone information in to the SAHQ. This will consist of the following:

- 1) Provide name, team number.
- 2) Turn in radio if one was issued to you.
- 3) Turn in any keys that were issued to you.

4) Please check with secretary for any outstanding messages/faxes that may have arrived duting your visit.

5) If storage of equipment is necessary, please see BOREAS staff for details.

6) If you are the team leader and your team is leaving, please see the mission manager or the study area manager for any remaining details that may need to be addressed before your departure.

7) Have a safe trip back.

Thanks for your cooperation.

# **Appendix D: BOREAS Inter-IFC Survival Guides**

# BOREAS INTER-IFC-94 SURVIVAL GUIDE (NSA)

# A. <u>HELP WITH SITE INFRASTRUCTURE</u>

Dan Hodkinson (NASA/GSFC) will coordinate any significant work that needs doing on site. Call 301/286-3621 or 301/286-3720.

# B. <u>BEFORE YOU LEAVE FOR HOME</u>

- Check with Dan Hodkinson about shutting down the site.
- Tell him when you are leaving.
- Give your radio back in.
- Turn in keys.

# C. <u>STORING MATERIAL OVER THE WINTER</u>

Material can be stored at the back of the Keewatin Airlines Hangar at Thompson Airport. Please contact Keewatin Air (204-677-3333) to arrange a time for dropping off.

# D. <u>EMERGENCIES AND EMERGENCY PHONE CALLS</u>

- (1) Medevac information is provided in Appendix B.
- (2) You can use your radio to make an emergency call:
  - Select Channel 3
  - Hold key down, transmit for 5 seconds.
  - Manitoba Tel Operator will come on line and will ask for registry and code number.
  - Respond: Prince Albert Registry, code number JW2 9062.
  - Give operator the number you want to call (Thompson Emergency Services is 677-7911)
- (3) Gil's Towing (24 hours) 778-8290

# E. <u>WEATHER INFORMATION</u>

Thompson Weather Office:	677-6900
Taped Hourly Update	677-4969

# BOREAS INTER IFC-94 SURVIVAL GUIDE (SSA)

## A. <u>HELP WITH SITE INFRASTRUCTURE</u>

Mary Dalman (PANP) will co-ordinate any significant work that needs doing on site. Call 306-663-5322.

## B. <u>BEFORE YOU LEAVE FOR HOME</u>

- Check with Mary Dalman about shutting down the site.
- Tell her when you are leaving.
- Turn in radio and keys to Mary Dalman.

# C. STORING MATERIAL OVER THE WINTER

Paddockwood School has space to store materials. To arrange space and dropoff times call:

Bob STEVENSON 306-989-2142 or Jim BRUCE 306-764-8941, 1511 306-922-3054

# D. EMERGENCIES AND EMERGENCY PHONE CALLS

- (1) Medevac information is provided in the EXPLAN Appendix B.
- (2) You can use your radio to make an emergency call:
  - Select channel 3 if in PANP
    - 11 or 13 if in Candle Lake or White Gull Basin Area.
  - Hold key down, transmit for 5 seconds.
  - Operator will come on line and will ask for registry and code number.
  - Respond: Prince Albert Registry, code JW2 9062.
  - Give operator number (P.A. Emergency Services is 764-6455)
- (3) The radio is monitored 24 hours a day by the Radio Branch in Prince Albert. If you are out of telephone range, please call out for emergency assistance. The Radio Branch has a map of the BOREAS sites and can get you emergency help.
- (4) Towing: 929-4662 (W), 929-3149(H)

# E. WEATHER INFORMATION

Prince Albert Weather Office: 953-8640

# **Appendix E: Customs and Shipping Information, Shipping Destinations, Importation of Samples, Immigration Formalities**

# E-1 Customs and Shipping Information

# BOREAS TRANSPORTATION AND IMPORTATION OF EQUIPMENT INTO CANADA

BOREAS has been granted a Remission Order in Council by Customs and Excise Canada allowing U.S. and International equipment to pass through customs exempt from duty, customs and GST charges.

Exemption only applies to equipment that will be returning to place of origin upon completion, (i.e. can not be sold or enhanced in Canada).

Please indicate BOREAS somewhere on your packages. It would be very helpful both for the people shipping your equipment who identify with the project name but not your name, and it would be useful for the people at the receiving end who will be storing your equipment. See section three of this appendix (F.3) for names and addresses of shipping destinations. **NO** C.O.D. shipments!

# OPTIONS FOR INVESTIGATORS BRINGING EQUIPMENT INTO CANADA

- 1) Self Importation (you accompany the equipment)
  - required at point of entry:
    - a) letter of remission,
    - b) letter of GST remission,
    - c) certification note (P.C. Order 1990-2848),
    - d) memorandum D21-4-1,
    - e) a **detailed** list of equipment specs, value, serial numbers, duration in Canada, etc. (e.g., a detailed invoice).

f) It is possible to go this alone and do the paperwork yourself, but it's probably not worth the time and hassle. If you do, be prepared for significant delays, especially if you are bringing numerous pieces of equipment with you. A broker is highly recommended for smooth passage. One that is aware of and has been formerly used by BOREAS:

> A.D. Rutherford and Co. Ltd. 910 Ferry Road Winnipeg Int'l Airport P.O. Box 2189 Winnipeg, Manitoba R3C 3R5 contact: Royal Unruh ph (204) 783-7096 fax (204) 783-1449 (can arrange brokerage at all border crossings)

- 2) Ground Transportation (unaccompanied)
  - required with shipment:
    - a) same as previous (a-e),
    - b) broker is highly recommended for smooth passage, (see item 1f above for contact)
    - c) expect warehouse charges and storage charges,
    - d) to minimize delays ensure that carrier/courier move directly between origin and destination, and is able to track your shipment. Try to find a shipper who will arrange brokerage as well.

- 3) Air Freight with Emery Worldwide through Winnipeg, Manitoba
  - Contact: Mr. Brian Raymond EMERY WORLDWIDE General Manager Unit 7, 2021 Sargent Avenue Winnipeg, Manitoba R3H 0Z8 ph: (204) 775-2676
    - a) quotes for cost and time to move your equipment can be obtained from Emery if you can provide shipping weight and volume. Despite a misunderstanding in the past, the quote will be from customer point of origin to site destination (Paddockwood, Keewatin, or Gardewine).
    - b) please contact Brian as soon as possible to make him aware of any particular needs or concerns you have.
    - c) if you are the least bit suspicious that your equipment could be classified as hazardous materials (gas powered generators are), contact Brian as soon as possible to verify. This equipment will require special paperwork and handling. If you don't have the proper paperwork, your shipment will not be there when you want it.

### advantages of using Emery:

- customs clearance and brokerage services included, storage at Winnipeg Airport provided at no additional cost,
- no weight restrictions,
- single point of contact for all shipments in and out of Canada.
- oversize and hazardous material handling
- single invoice billing
- Emery can provide ground transportation

### 4) Other

- If the option you plan to use does not fit into one of the above categories, most of the information given still applies,
  - a) anything moving across the border is going to require items a-e listed in 1 above.
  - b) provide your carrier or shipping department with this information and they should have everything they need to clear it through customs. Please call either Jaime Nickeson or Gillian Traynor if you have any questions.

Jaime Nickeson	GSFC	(301) 286-3373
		FAX 1757
Gillian Traynor	CCRS	(613) 947-1292
-		FAX 1406

You will find as part of this Appendix, items 1a, b, c, d included in the following pages.

Canadian customs may not be all you need to be concerned with. It is a good idea to register your equipment with U.S. customs before departing. You may have done this already if you have previously traveled internationally with your equipment. In particular, U.S. Customs wants to see proof that foreign made items were with you when you exited the U.S. This can be done easily at your local customs office ahead of time by taking either your equipment, a receipt, or some kind of proof that you own the equipment (if you do not take the equipment, the papers you take to customs must include the manufacturer serial number). The form you need is called customs form 4455 and is called a certificate of registration. Having this form will help you when you go through U.S. customs on your return to the states. If your equipment is not registered, your shipping document, with serial numbers, should be enough proof to show that you are returning to the U.S. only with equipment you brought in to Canada. Be prepared to pay duties on equipment purchased in Canada when totals exceed \$400.

Attention: Mrs. Cindy De Cuypere Canadian Administrator for BOREAS

Subject: BOREAS importations, Joint Canada-United States Government <u>Projects Remission Order, P.C. 1990-2848.</u>

Dear Mrs.. De Cuypere:

This refers to your facsimiles of November 15 and 21, 1991, addressed to Mr. R.R. Teal, in which you request our authorization to consider the research project BOREAS (Boreal Ecosystems-Atmosphere Study) for duty relief under the Joint Canada-United States Government Projects Remission Order, P.C. 1990-2848.

As per your documentation, BOREAS is an international cooperative field and analysis research project which is jointly sponsored by the U.S. National Centre for Atmospheric Research (NCAR) under contract to the National Aeronautics and Space Administration (NASA; a U.S. government agency) and the Canadian government departments of Energy, Mines and Resources, Forestry, Environment, and Agriculture. We are pleased to advise you that this study is considered to be a joint Canada and United States project and falls within the provisions of the Joint Canada-United States Government projects Remission Order, P.C. 1990-2848 (copy attached).

Canadä

Department Ministère of National Revenue du Revenu national (Customs and Excise) (Douanes et Accise) Under this order, goods which are, or will become the property of the U.S. government may be imported into Canada by the U.S. government or its authorized agent, or a Canadian Government Department or Crown Corporation acting on behalf of the U.S. Government.

Please note that the relevant memorandum D21-4-1 is under revision, however, the instructions contained therein remain in effect and it will be necessary for you to provide a list of imported goods with the customs accounting document bearing the certificate as specified in paragraph 7 to the memorandum D21-4-1. You are required to submit a copy of this letter to each accounting document or refund claim.

I hope this information will be assistance to you.

Yours truly,

Alende Lungre

Claude Levesque, Drawbacks and Refunds Policy Unit, Duties Relief Programs.

c.c.: Mrs. J. Hoople, Tax Policy Officer, Customs & Excise

Ottawa, Canada K1A 0L5

March 22, 1993

Jaime Nickeson BOREAS Project

Dear Jaime,

This letter is in response to our conversation regarding the importation of articles for use in the BOREAS Project.

Claude Levesque has already given you a letter, authorizing your organization to import articles under the Joint Canada-United States Government Projects Remission Order. During our conversation, you asked whether this authorization under the order would remit duty as well as G.S.T.

I have discussed this project with Joanne Hoople of our Excise branch, Should you wish to receive relief from domestic purchases, you must contact Ms. Hoople directly for correct procedures and approval, Mr. Levesque's letter of authorization includes remission of G.S.T. for articles at the time of importation.

I trust this letter will clarify this issue, and help to make your importations smoother. Should you have any questions regarding this order or letter of authorization, please contact me at (613) 954-6888.

Sincerely,

B. T. (Tim) Elliott Duties Relief Programs

To Whom It May Concern,

I hereby certify that the articles or goods herein described are to be used as part of the BOREAS experiment which falls within the provisions of the Joint Canada-United States Government projects Remission Order. The BOREAS investigators are funded by the U.S. or Canadian government and the equipment being imported is for use solely and exclusively in this joint U.S.-Canada BOREAS experiment and are exempt from customs duties and excise taxes.

### Southern Study Area

All field and lab equipment should be shipped to the following address in the SSA:

BOREAS Project c/o Paddockwood School Paddockwood, Saskatchewan, CANADA S0J 1Z0 ATT: Bob Stevenson (306)989-2142, or Jim Bruce Shop: 306/764-8941 Office: 306/764-1511 Home: 306/922-3054

Equipment sent to these people will be stored in a secured area out of the weather until you arrive to retrieve it. Contact with these people prior to shipping would be advisable. Please try to make your contacts during civilized hours (i.e. figure out the time difference before phoning Bob Stevenson).

# E.3 Importation of Plant and Soil Samples

Circular Q-330.300-1 Soil (6-93)

> U.S. Department of Agriculture Animal and Plant Health Inspection Service Plant Protection and Quarantine Federal Building Hyattsville, Maryland 20782

# IMPORTING FOREIGN SOIL

The animal and plant health inspection service (APHIS) is the agency within the U.S. Department of Agriculture charged with enforcing quarantine regulations designed to protect U.S. agriculture from the introduction of potentially destructive plant and animal pests and diseases.

Soil is strictly controlled under APHIS quarantine regulations because it can readily provide a pathway for the introduction of a variety of dangerous organisms into the United States. Pest and disease concerns associated with soil include animal and plant viruses, bacteria, and fungi; as well as nematodes, noxious weeds, and certain life stages of destructive exotic insects.

Soil cannot be adequately and practically inspected for the spectrum of organisms which might be harmful. For this reason, the movement of soil into the United States from foreign sources is prohibited, and movement within the continental U.S. is restricted unless authorized by APHIS under specific conditions and safeguards.

The following discussions will provide detailed information about the authorizations provided by APHIS for soil movement.

# Scope of the Regulations:

Title 7 of the Code of Federal Regulations (CFR), Part 330.300 describes the authority for APHIS policies and procedures related to the importation of soil from foreign sources as well as from Hawaii, Guam, Puerto Rico, and the U.S. Virgin Islands, but not including soil from Canada unless imported from Newfoundland or the Land District of South Saanich on Vancouver Island of British Columbia.

Regulated items include materials such as topsoil, forest litter, compost, humus, earthworm castings, and any of a variety of items composed of largely unidentifiable plant parts or mixtures of organic and inorganic ingredients which are capable of supporting biological activity and therefore capable of providing the means for carrying and introducing harmful pests or diseases.

Items which are outside the scope of the regulations include; pure sand, clay, talc, or other pure mineral articles, as well as rocks, gravel and ore which are not contaminated with soil or organic debris. Peat is also unregulated, provided it is pure.

Cosmetic mud and other mud products may also be exempt from regulation. However, mud products must be processed to a smooth consistency and visibly free of contaminants. Mud which has not been commercially processed, must be smooth, uncontaminated, and accompanied by foreign certification stating that the mud was taken from a source at least 7 feet below the water surface.

Materials such as those described above can be considered outside the scope of APHIS soil regulations. However, such items remain subject to inspection at the U.S. port of arrival.

All shipments must be inspected to establish the nature and identity of the imported material and verify that the shipment is free of pests and prohibited contaminants. Any shipment or portion of a shipment may be refused or require treatment based upon inspection findings.

Therefore, non-soil items should be absolutely pure, with no visible signs of soil, insects, organic debris, or prohibited contaminants. Items which appear soil-like are regulated as soil unless determined to be exempt based upon inspection.

Page

# Canadian Soil

Soil from Newfoundland and from that portion of the Municipality of Central Saanich in the Province of British Columbia east of the West Saanich Road, Canada is regulated as foreign soil. <u>Soil from other parts</u> of Canada may be imported into the U.S. subject only to inspection and verification of the origin.

# Domestic Soil

Soil from Guam, Hawaii, Puerto Rico, and the U.S. Virgin Islands is handled as foreign soil and is authorized movement into the continental U.S. under the provisions described for foreign soil.

Domestic soil (from within the continental U.S.) may be restricted movement from specific areas under APHIS quarantine regulations. When required by quarantine, the movement of domestic soil may be authorized through the development of a compliance agreement established between the local APHIS office and the person or firm responsible for handling the soil.

Persons desiring more information related to the movement of domestic soil are encouraged to contact the local Plant Protection and Quarantine(PPQ) office and State agricultural officials. The PPQ Permit Unit in Hyattsvile, Maryland can help identify appropriate offices. The telephone number for the Permit Unit is Area Code (301) 436-8645.

# Hawaii and Puerto Rico

Soil shipments from Hawaii and Puerto Rico are treated and/or authorized by PPQ in Hawaii or Puerto Rico before being released for movement to the continental United States.

# Israel

Small amounts of soil from Israel may be authorized for importation without treatment at the port of entry. A special permit is required, and shipments must be accompanied by a certificate which states that the soil is non-agricultural and has been heat treated in Israel.

Circular Q.37-19 05/93

#### CANADIAN PLANT PROPAGATING MATERIAL - ENTRY REQUIREMENTS

Plants originating in the Province of Newfoundland\* and the Land District of South Saanich (Province of British Columbia)\*, are subject to special requirements.

Certain genera of palm plants are prohibited - please see enclosed Part 319.37, pages 5-9.

#### All Citrus and Citrus relatives are prohibited.

The material listed below is either prohibited entry or subject to written permit requirements. When reference is made to more that one footnote, both restrictions apply, except when noted otherwise. Seeds are not included unless specifically mentioned.

Abelmoschus (seeds)	(15)	Pinus	(4)
Allium sativum (garlic)	(16)	(pine)	
(bulbs)		Planera	(10)
Berberis	(1,11)	(waterelm)	
(barberry)		Prunus	(3)
Bromeliads	(17)	(almond, apricot)	
Castanea	(8)	cherry, peach, plum	1)
(chestnut)		Prunus seeds	(14)
Castanopsis	(9)	Pyrus	(3)
(chinquapin)		(pear)	
Chaenomeles	(3)	Ribes	(6)
Corn seed	(12)	(currants and	
Corylus	(2)	gooseberries)	
Cydonia	(3)	Rubus	(1,13)
(quince)		(blackberry, boyser	1-
Hibiscus (seeds)	(15)	berry, dewberry,	
Humulus	(1)	raspberry)	
(Hops)		Ulmus	(10)
Mahoberberis	(1,11)	(elm)	
Mahonia	(1,11)	Vitis	(7)
Malus	(3)	(grape)	
(apple, crabapple)		Zelkova	(10)

(1) Enterable under post entry quarantine permit for detention growing on premises controlled by the importer.

\*See page 3.

- (2) Written permit required when originating from provinces east of <u>Manitoba if destined to Oregon, or Washington.</u> Enterable without permit from provinces west of and including Manitoba if destined to Oregon or Washington, and from all Canadian provinces when destined to other States.
- (3) (<u>Chaenomeles</u>, <u>Cydonia</u>, <u>Malus</u>, <u>Prunus</u>, <u>Pyrus</u>) Certified materials enterable under written permit when accompanied by a valid Canadian phytosanitary certificate. <u>Malus</u> from British Columbia is subject to special certification, permit, and entry requirements.
- (4) (<u>Pinus</u>) All pines are enterable under written permit when destined to the States of California, Idaho, Montana, Oregon, and Utah. 5-leaved pines are enterable under written permit when destined to Wisconsin. No permit required when destined to States other than preceding.
- (5) Reserved.
- (6) (<u>Ribes</u>) Written permit required for entry from all Provinces of Canada of <u>Ribes</u> spp. plants and seeds destined to Massachusetts. New York, West Virginia, and Wisconsin. No permit required for other destinations.
- (7) (<u>Vitis</u>) Enterable under written permit for all states. Also, subject to virus indexing when destined to California, Oregon, and Washington.
- (8) (<u>Castanea</u>) Prohibited entry.
- (9) (<u>Castanopsis</u>) <u>Written permit required when destined to California</u> <u>or Oregon.</u> No permit required for other destinations.
- (10) (<u>Planera</u>, <u>Ulmus</u>, <u>Zelkova</u>) <u>Written permit required when destined</u> <u>to California</u>, <u>Nevada</u>, <u>or Oregon</u>. No permit for other destinations.
- (11) (<u>Berberis</u>, <u>Mahoberberis</u>, <u>Mahonia</u>) Entry restricted to plants of those species and varieties which have been designated as resistant to black stem rust. All other species and varieties are not admissible. <u>All seed is prohibited entry</u>.
- (12) Subject to Quarantine 41 restrictions. Special certification for European corn borer may be required. <u>Written permit required</u>.

- (13) (<u>Rubus</u>) Permit and postentry quarantine unless at the time of arrival in the United States the phytosanitary certificate of inspection accompanying the plants contains an additional declaration that the articles were found by the Plant Protection Service of Canada to be free of <u>Rubus</u> stunt agent based on visual examination and indexing of the parent stock.
- (14) (<u>Prunus</u>) Seeds enterable under written permit when destined to the States of Colorado, Michigan, New York, Washington, and West Virginia. No permits are required for other destinations. <u>Prunus</u> seeds in the subgeneus Cerasus require certification that plum box (Sharka) virus does not occur in the country where the seed was grown.
- (15) (<u>Abelmoschus, Hibiscus</u>) Seeds are subject to treatment upon arrival at a Plant Protection and Quarantine inspection stations. <u>Written permit required</u>.
- (16) (<u>Allium sativum</u>) Bulbs require a written permit.
- (17) (<u>Bromeliads</u>) When destined to Hawaii, subject to postentry quarantine restrictions. <u>Written permit required</u>.

All plants, plant parts, seeds, and bulbs not previously mentioned by be imported without written permit.

A phytosanitary certificate should accompany the shipment; however, a phytosanitary certificate is <u>not</u> required for noncommercial lots of houseplants. Houseplants are defined as those plants that have been grown or are obviously intended for growth in a residence (except ACitrus3 spp.). A phytosanitary certificate is required for outdoor plants such as trees and shrubs which are normally grown outside.

Mail shipments of admissible plants from Canada which are not subject to written permit requirements may be addressed directly to the recipient. Green-and-yellow mailing labels are not longer required. Such parcels must be plainly labeled to identify the contents.

\*All admissible plants from Newfoundland and the portion of the Municipality of Cenral Saanich in the Province of British Columbia east of the West Saanich Road must be free of soil and accompanied by a Canadian phytosanitary certificate. Postentry quarantine provisions will apply when applicable. No written permit is required except for plants and seeds listed on the first page. Also, any exceptions stated in the is circular will apply.

# **E.4** Immigration Formalities

The agreement signed between Canada and the United States for BOREAS is reproduced in Appendix F. This forms the basis for some of the special arrangements made vis-a-vis the waiving of work permit fees, etc. All U.S. PI's should have received a letter like the example attached on the next page - this plus the agreement should prevent you from being stuck with a work permit charge or related hold-ups at immigration. If you don't have such a letter, contact Gill Traynor at the BOREAS Secretariat 613/947-1292.

Natural Resources Ressources naturelles Canada

May 1, 1994

To whom this may concern,

This letter is to certify that Dr. Piers J. Sellers is an approved Boreal Ecosystem-Atmosphere Study (BOREAS) Principal Investigator BOREAS is a joint U.S. - Canada research project to study the interactions between the boreal forest and the atmosphere. The BOREAS field campaigns will be conducted in Canada in the regions of Prince Albert, Saskatchewan, and Thompson, Manitoba. U.S. - Canada cooperation for BOREAS has been formalized through a Government-to-Government Agreement. The Agreement requires that arrangements be made for free customs clearance of equipment and data and that immigration documentation fees (i.e., work permits) be waived for persons working on BOREAS. These provisions are to be applied to Dr. Piers J. Seller's travel to and from Canada for participation in BOREAS.

Letters for BOREAS Co-Investigators signed by the above-named Principal Investigator and attached to this letter will extend the above provisions to the named Co-Investigator(s).

Leo Sayn-Wittgenstein Director-General, Canada Centre for Remote Sensing

# Appendix F: Agreement between United States and Canada

This agreement plus a letter like the example shown in Appendix E-4 should permit the waiving of work permit charges for U.S. Investigators.

AGREEMENT BETWEEN THE GOVERNMENT OF CANADA AND THE GOVERNMENT OF THE UNITED STATES OF AMERICA ON COOPERATION IN THE BOREAL ECOSYSTEM-ATMOSPHERE STUDY (BOREAS)

ACCORD ENTRE LE GOVERNMENT DU CANADA ET LE GOUVERNEMENT DES ETATS-UNIS D'AMERIQUE CONCERNANT LA COOPERATION DANS LE CADRE DE L'ETUDE DE L'ATMOSPHERE ET DES ECOSYSTEMES BOREAUX (BOREAS) WHEREAS:

The Government of Canada and the Government of the United States, herein referred to as "the Parties," have identified a mutual interest in conducting a joint study to better understand the interaction between the boreal forest biome and the atmosphere; and

The Parties wish to establish a framework for cooperation; The Parties, therefore, agree as follows:

#### ARTICLE 1

#### PURPOSE

The purpose of this Agreement is to provide the basis for cooperation between Energy, Mines and Resources (EMR), a department of the Government of Canada, and the National Aeronautics and Space Administration (NASA), an agency of the Government of the United States of America, herein referred to as "the Participants", regarding the joint Canada-U.S. Boreal Ecosystem-Atmosphere Study (BOREAS).

#### ARTICLE 2

#### OBJECTIVES

A. The Parties shall undertake BOREAS to study the interactions between the boreal forest biome and the atmosphere in order to clarify the roles of these interactions in global change. The study will focus on processes that can be appropriately addressed in a one-year intensive field measurement project supported by three to four years of less intensive in situ and remote sensing monitoring.

B. The specific objectives of BOREAS are:

1. to improve understanding of the biological and physical processes and states which govern the exchanges of carbon, water, trace gases, energy, and heat between boreal forest ecosystems and the atmosphere with particular reference to those processes and states that may be sensitive to global change;

2. to develop the use of remote sensing techniques to transfer understanding of the above processes from local scales to regional scales; and

3. to provide personal development, research, and educational opportunities for individual researchers sponsored by both Parties participating in BOREAS.

#### ARTICLE 3

#### PARTICIPATION

The Parties shall conduct BOREAS as part of the U.S. and Canadian Α. Global Change Research Programs. The goals and objectives of BOREAS are compatible with and have been endorsed by the International Geosphere-Biosphere Programme (IGBP) and the International Satellite Land Surface Climatology Project (ISLSCP) of the World Climate Research Program (WCRP). Preliminary scientific planning has determined that BOREAS will be a joint U.S.-Canada initiative in which NASA will lead the U.S. participation in this study and will coordinate the involvement of the National Oceanic and Atmospheric Administration (NOAA), the Environmental Protection Agency (EPA), and the National Science Foundation (NSF). The Canada Centre for Remote Sensing (CCRS) of the Surveys, Mapping, and Remote Sensing Sector will act on behalf of EMR to implement the Canadian contributions to this study. CCRS has been designated to lead the Canadian participation in the study in cooperation with the Canadian BOREAS Coordinating Committee (CBCC). The CBCC will coordinate the involvement of Forestry Canada, Environment Canada, Agriculture Canada, the National Research Council of Canada (NRC), and the Natural Sciences and Engineering Research Council of Canada (NSERC).

в. BOREAS will consist of a three t four year period of low level in situ monitoring observations of two boreal forest biome sites in central Canada. These roughly 400-600 square kilometer sites are the Prince Albert National Park region in Saskatchewan and the Nelson House region near Thompson, Manitoba. In the summer of 1993, one pilot intensive observation campaign was conducted. In 1994, up to five intensive field campaigns will be conducted to cover mid-winter, spring thaw, an early, mid-, and late growing season conditions. These intensive field campaigns will involve approximately 75 Principal Investigator-led international teams, extensive in situ observations at each site, several U.S. and Canadian remote sensing aircraft, and satellite observations. It is planned to base the smaller aircraft (e.g., NASA helicopter and C-130) at Prince Albert and Thompson, the larger aircraft (e.g., NASA DC-8) at Saskatoon and/or Churchill, and the NASA ER-2 at Spokane, Washington,

C. A data and information system, the BOREAS Information System (BORIS), will be established to provide the BOREAS Science Team members with a data system from which data for the whole project may be queried, accessed, and extracted. Participating scientists will be expected to submit their data to BORIS in a timely fashion. All those participating in BOREAS shall have access to BORIS and all BOREAS data distributions will be through BORIS, or through the long-term archive to follow BORIS.

#### ARTICLE 4

#### RESPONSIBILITIES OF THE PARTICIPANTS

A. NASA, for its part, will use its best efforts to ensure fulfillment of the following responsibilities:

1. Participants with CCRS in the planning of the coordinated U.S. and Canadian aircraft and ground-based measurements to be obtained in order to fulfill the scientific objectives of the joint mission;

2. Coordinate the involvement of other U.S. agencies in BOREAS;

3. Arrange, jointly with the participating Canadian agencies, for the provision of required lodging for the U.S. component of the joint team;

4. Provide NASA aircraft equipped with instrumentation for the BOREAS study. Additionally, arrange for proper operational and associated ground support for the NASA aircraft, and coordinate flight of the other U.S. aircraft (e.g., aircraft provided by NOAA, the National Center for Atmospheric Research (NCAR), and the University of Wyoming) participating in the campaign;

5. Organize and conduct the BOREAS aircraft expeditions in consultation with EMR;

6. Provide certain Core Measurements for BOREAS (through in-house labor or contracted support), including agreed-upon surface measurements, tower-based measurements, automatic meteorological stations, aircraft remote sensing measurements and in situ measurements, satellite data, and Geographic Information System (GIS) components. These will be provided in accordance with applicable U.S. laws and NASA data policies;

7. Process, correct, quality assure, and document agreed-upon Core Measurements data and deliver them to the BORIS in a timely fashion;

8. Coordinate and execute agreed-upon joint instrument calibration and comparison experiments and analyses;

9. Participate jointly with CCRS and the other participating agencies in the analysis and publication of the data and results obtained from this cooperative project;

10. Support, staff, and manage the U.S. BOREAS Project Office, including the BORIS;

11. Provide funding for U.S. proposals and sponsor the participation of the foreign scientists selected under the joint U.S.-Canada solicitations for scientific participation in BOREAS; and

12. Provide certain support services to be performed in Canada in fulfillment of the objectives of BOREAS. These services include, but are not limited to, the following: BOREAS infrastructure, trails, vehicles, aerial photography, flux towers, site research facilities (including laboratory and storage space); site managers, liaison-field support, field site security, and labour at the study sites. NASA will procure these support services through CCRS by separate contract or other appropriate agreement. In connection with such a procurement, NASA will not pay as an allowable cost, salaries of Canadian government employees.

B. EMR, for its part, will use its best efforts to ensure fulfillment of the following responsibilities:

1. Participate with NASA in the planning of the coordinated U.S. and Canadian aircraft and ground-based measurements to be obtained in order to fulfill the scientific objectives of the joint mission;

2. Coordinate the involvement in BOREAS of Environment Canada, Forestry Canada, Agriculture Canada, the NRC, and other Canadian participants, and provide a link for discussions with the NSERC;

3. Obtain from Canadian authorities necessary authorization in order to conduct the subject scientific project. In addition, EMR will assist and guide NASA in complying with Canadian government legislation and regulations with respect to aircraft activities and surface level operations.

4. Arrange, jointly with NASA, for the provision of required lodging for the Canadian component of the joint team;

5. Provide CCRS aircraft equipped with instrumentation for the BOREAS study. Additionally, arrange for proper operational and associated ground support for the CRS aircraft and coordinate other Canadian aircraft (e.g., aircraft provided by the Institute of Aerospace Research (IAR) Twin Otter and the Ontario Center for Remote Sensing's Navajo Chieftain) participating in the campaign;

6. Participate with NASA and the other participating agencies in the organization and conduct of the BOREAS aircraft expeditions.

7. Coordinate the provision of meteorological data provided by Environment Canada, including satellite cloud images, and assistance in forecasting, for planning of aircraft missions for the duration of the BOREAS mission;

8. Provide or arrange for the provision of certain core measurements for BOREAS (through in-house labor or contracted support), including agreed-upon surface measurements, tower-based measurements, automatic meteorological stations, aircraft remote sensing measurements and in situ measurements, satellite data, and GIS components. In particular, provide agreed-upon Landsat Thematic Mapper (TM), Multispectral Scanner System (MSS) and Advanced Very High Resolution Radiometer Local Area Coverage (AVHRR LAC) data. These will be provided in accordance with Canadian data distribution agreements with satellite operators and data distributing companies; 9. Process, correct, quality assure, and document agreed-upon core measurement data and deliver them to the BORIS in a timely fashion;

10. Coordinate and execute agreed-upon joint instrument calibration and comparison experiments and analyses;

11. Participate jointly with NASA and other participating agencies in the analysis and publication of the data and results obtained from this cooperative project;

12. Support, staff, and manage the Canadian BOREAS Secretariat;

13. Provide funding for CCRS proposals selected under the joint U.S.-Canada solicitations for scientific participation in BOREAS and communicate information on the funding commitments of the other Canadian agencies involved in BOREAS; and

14. On behalf of NASA, arrange for the provision of the support services to be performed in Canada in fulfillment of the objectives of this Agreement, as described in paragraph A.12 of NASA's responsibilities above, pursuant to the requirements of a contract or other appropriate arrangement entered into with NASA.

#### ARTICLE 5

#### PROJECT MANAGEMENT

The Participants' technical points-of-contact to be responsible for coordinating the agreed-upon functions and responsibilities of each Participant are as follows:

The NASA technical point-of-contact:

Manager Terrestrial Ecology Program Science Division Office of Mission to Planet Earth NASA Headquarters Washington, DC 20546 USA TEL: (202) 358-0272 FAX: (202) 358-2771

The EMR technical point-of-contact:

Director General Canada Centre for Remote Sensing Energy Mines and Resources Canada 588 Booth street 3rd Floor, Room 327 Ottawa, Ontario K1A 0Y7 CANADA TEL: (613) 947-1222 FAX: (613) 947-1382

#### ARTICLE 6

#### FUNDING ARRANGEMENTS

Each Party agrees to bear the costs of discharging its respective responsibilities as outlined above under this Agreement. The activities o the parties and the participants under this Agreement are subject to the availability of appropriated funds.

#### ARTICLE 7

#### PUBLIC INFORMATION

The Parties agree that the release of public information regarding this project may be made by the appropriate Party for its own portion of the program as desired and insofar as participation of the other Party is involved, after suitable consultation.

#### ARTICLE 8

#### SCIENTIFIC DATA

The Parties agree that there shall be no period of exclusive use of BOREAS data by the BOREAS Science Team. The BOREAS investigators shall have a reasonable period of time from the completion of the BOREAS field expedition to perform documentation, verification, and correction of their data prior to public release of the data sets. Each BOREAS investigator shall be expected to provide copies of the data collected to BORIS for deposit in the BORIS archive on a schedule that shall permit the archive to be released to the international scientific community as soon as possible, and in accordance with the data handling procedures adopted by the BOREAS Science Team

The Parties agree that the results of the investigations shall be made available to the scientific community in general through publication in appropriate journals or other established channels. In the event such reports or publications are copyrighted, the parties shall have a royalty-free right under the copyright to reproduce, use, and distribute such copyrighted work for their own purposes.

#### ARTICLE 9

#### INVENTION AND PATENT RIGHTS

The parties agree that nothing in the Agreement shall be construed as granting or implying any rights to, or interest in, patents or inventions of the parties or their contractors or subcontractors.

#### ARTICLE 10

#### LIABILITY

The Parties agree that, with respect to activities undertaken pursuant to this Agreement, neither Party shall make any claim against the other with respect to injury or death of its own or its contractors' or subcontractors' employees or investigators' employees or with respect to damage of any kind to or loss of its own or its contractors' or subcontractors' or investigators' property caused by either Party, or the Party's contractors, subcontractors or investigators, whether such injury, death, damage or loss arises through negligence or otherwise, except in the case of willful misconduct. The Parties agree, in the event of damage to third parties for which there is liability under national or international law, to consult promptly as to the possibility of an equitable sharing of any payments that have been or may be agreed in settlement.

This cross-waiver of liability shall not be applicable to claims between a Party and its contractors and subcontractors or to claims made by a natural person.

#### ARTICLE 11

#### IMMIGRATION DOCUMENTATION, AIRPORT AND CUSTOMS FEES

Both Parties will make best efforts, as appropriate, to arrange for the appropriate governmental authorities to waive any immigration documentation fees for persons working on BOREAS; to waive any landing, navigation, airways or airport entry and departure fees for aircraft required for BOREAS; and to provide free customs clearance of equipment and data required for BOREAS.

#### ARTICLE 12

#### EXCHANGE OF TECHNICAL DATA AND GOODS

Each Party shall furnish to the other Party only those technical data and goods necessary to fulfill the responsibilities of the furnishing party under this Agreement. It is the intent of the Parties to effect such a transfer without restrictions as to use or disclosure, subject to the following:

1. In the event a Party finds it necessary to furnish technical data in carrying out its responsibilities under this Agreement that are proprietary, and for which protection is to be maintained, such technical data shall be marked with a notice indicating that it shall be used and disclosed by the receiving Party and its contractors and subcontractors only for the purposes of fulfilling the receiving Party's responsibilities under this Agreement, and that the technical data shall not be disclosed or retransferred to any other entity without prior written permission of the furnishing Party. The receiving Party agrees to abide by the terms of the notice, and to protect any such marked technical data from unauthorized use and disclosure. 2. In the event a Party finds it necessary to transfer technical data and goods in carrying out its responsibilities under this Agreement that are export-controlled, the furnishing Party shall mark such technical data with a notice and identify such goods. The notice or identification shall indicate that such technical data and goods shall be used and such technical data shall be disclosed by the receiving Party and its contractors and subcontractors only for the purpose of fulfilling the receiving Party's responsibilities under this Agreement. The notice or identification shall also provide that such technical data shall not be disclosed, and such technical data and goods shall not be retransferred, to any other entity without prior written permission of the furnishing Party. The Parties shall abide by the terms of the notice or identification and shall protect any such marked technical data and identified goods. Nothing in this article requires the Parties to transfer technical data and goods contrary to national laws or regulations related to export controls or control of classified data.

3. The Parties are under no obligation to protect any unmarked technical data or unidentified goods.

#### ARTICLE 13

#### SETTLEMENT OF DISPUTES

The Parties agree that any disputes as to interpretation or implementation of this Agreement shall be resolved through consultation between the parties. The dispute shall be first referred to the NASA Associate Administrator for Mission to Planet Earth and the Assistant Deputy minister (Surveys, Mapping and Remote Sensing) of EMR for resolution. Any dispute which cannot be resolved at this level shall be referred to the NASA Administrator and the Deputy Minister of EMR for settlement.

#### ARTICLE 14

#### AMENDMENTS

This Agreement may be amended by written consent of the Parties.

#### ARTICLE 15

#### ENTRY INTO FORCE AND TERMINATION

This Agreement shall enter into force upon signature. It shall remain in force for three years after the completion of the final BOREAS campaign. Either Party may terminate this Agreement upon ninety day's written notice following consultation with the other Party.

# Appendix H: BOREAS Guidelines for the Conduct of Investigators in the Field for the Northern and Southern Study Areas

PREAMBLE: On arrival in the field, every BOREAS Investigator and staff member becomes an ambassador for the project. Both northern and southern study areas are traditionally used and highly valued by local peoples. Public.and professional interest in the project is high. As a "leading edge" environmental research project, BOREAS is expected to be exemplary in its project execution and operating protocols. Global altruism aside, the success of BOREAS will be measured as much by the deportment and actions of individuals in the field, as by the quality of science produced. The following guidelines have been developed in good faith to assist with achievement of BOREAS objectives, and require the full cooperation of all parties.

### 1.0 ACCESS TO NORTHERN STUDY AREA (NSA) SITES: NELSON HOUSE

Investigators would do well to remember that boreal ecosystems have been utilized for millennia by aboriginal peoples whose very existence has depended on the development of an intimate relationship with the land, and a thorough appreciation for the intrinsic harmony binding ecosystem components.

<u> </u>	
Traditional land use present and past	1.1 Investigators should familiarize themselves with traditional land use activities in the area and respect the rights of traditional users conducting subsistence harvest and other cultural activities. Map available from BORIS.
	1.2 The Nelson House First Nation (NHFN) conducts spiritual ceremonies periodically at or near Mile 20 of highway #391. <b>Please do not disturb.</b>
	1.3 First nation's cultural features encountered could include artifacts and burial sites. Do not disturb under any circumstances; but do inform the Nelson House Chief or council of any suspected find. The significance of artifacts or features is greatly diminished if disturbed from the environmental context.
Security and logistics	1.4 No sites have gates; all sites except the beaver pond have locked huts. Hut keys are available from the site captains or from the site manager "off season" or study area manager during field campaigns.
	1.5 Two ARGOs will be available for use on NSA sites, one dedicated to OBS, the second a "floater" as needed. Contact site manager or study area manager.

2.0 ACCESS TO	SOUTHERN STUDY AREA (SSA) SITES: (FEN, YJP, OJP, OBS)
Security and logistics	<ul> <li>2.1 Access to FEN, YJP, OBS is controlled by locked gates keyed alike. Keys will be made available through the SSA project office in Candle Lake, or in "off season" through the site manager. OJP is indefensible, with access available by several logging roads, hence no gate. Hut keys are available as above, with site Captains having executive powers for use.</li> <li>2.2 Speed limit is 15 km/hr on all access trails for investigator and wildlife safety. Reduced speed will minimize vehicle damage and save on trail repairs.</li> <li>2.3 Site visits should be coordinated to allow researchers to travel together whenever possible to minimize the number of vehicles parked at the trail head.</li> <li>2.4 An ARGO will be used at the OBS site to transport equipment. A boardwalk provides pedestrian access.</li> </ul>

3.0 GENERAL C	GUIDELINES FOR ALL SITES
Check-In & Out Procedure	3.1 All investigators must notify the Site Manager "off season" or heck-in- and out at the Operations Center during field campaigns.
Wildlife	<ul><li>3.2 Black Bears, Elk and Moose are common in the study areas, and are dangerous.</li><li>Bear sightings should be documented and reported.</li><li>3.3 All investigators are to make themselves familiar with bear country</li></ul>
	<ul><li>etiquette. Read available brochures like "You are in bear country" provided by Parks Canada.</li><li>3.4 A wildlife reporting sheet will be posted inside one hut at each site, to be maintained daily by investigators.</li></ul>
	3.5 Incidents of injured wildlife, damage to property, or perceived behavioral threat to persons are to be reported immediately to the BOREAS Operations and site manager. Provincial Conservation Officers or national park Wardens will be notified of potential problems or incidents.
	3.6 Do not feed, harass or entice wildlife. Some species are notorious equipment wreckers while others like fox and skunk are known rabies carriers.

3.0 GENERAL C	GUIDELINES FOR ALL SITES (continued)
Waste Management	3.7 Use of pit privies is mandatory. Investigators are responsible for maintaining the facilities and plumbing in a working manner.
	3.8 Grey water is to be disposed of only in a designated pit on site. This involves soapy wash water only, uncontaminated with chemicals.
	3.9 All garbage is to be transported from the site on a daily basis, and disposed of appropriately in a regional landfill or recycling repository. Sorted aluminum, tin, glass and paper are collected at Waskesiu Lake, Christopher Lake and Prince Albert. Hazardous goods or containers must be deposited at a registered facility.
	3.10 Burning of garbage or other waste is not acceptable.
Food Management	3.11 Unattended lunches are an invitation for unwanted wildlife encounters. Food is to be kept on-person or within hard-sided buildings. Bears have no respect for tents and other fabric property.
	3.12 Overnight storage of food is not acceptable.
Water supplies	3.13 Local natural water bodies may not be used for potable or wash water.
Firearms	3.14 Firearms are not permitted within BOREAS operating areas.
Camping	3.15 Camping at flux tower sites (except PANP Aspen) may be permitted at the discretion of the flux sites captains. Provincial and National Park facilities are located within a reasonable commute of all sites.
Flux site etiquette	3.16 Vehicle and foot traffic is restricted to specific boardwalks and routes to reduce site disturbance. Foot trail networks and restricted areas will be identified at each flux site by Site Captains.
	3.17 Smoking and fires are not permitted at flux sites.
	3.18 Site Captains have supreme authority and must be contacted about all activities at that flux site.
	3.19 All flagging at flux sites must be labelled with team ID (eg. TE-1) and date, otherwise it is fair game for removal.
Chemical handling, storage, disposal	3.20 Canadian Transport of dangerous goods, Canada Labour Code and WHMIS protocols are to be followed, in addition to applicable industry codes of good practice. (WHMIS - Workplace Hazardous Material Information System).
uloposul	3.21 Site Captains are responsible for maintaining a spill contingency capability for all chemicals used at their respective sites.
Fuel Spills	<ul><li>3.22 BOREAS is responsible for providing a fuel spill contingency plan including containment capability for sites powered by generators.</li><li>3.23 Investigators using sites shall familiarize themselves with action protocols in the event of a fuel spill, to ensure that proper authorities are notified immediately.</li></ul>

3.0 GENERAL C	GUIDELINES FOR ALL SITES (continued)
Cultural resources	3.24 Any artifacts observed are not to be disturbed or moved. Observations may be reported to local authorities which may be the Nelson House First Nation office, Prince Albert National Park or the respective provincial museums of natural history.
Public communication	3.25 Investigators should endeavour to transfer information to the local public in the form of a community presentation or other means. Communicating project science in lay terms will help to foster local support for BOREAS.
Safety	<ul> <li>3.26 Standard first aid equipment will be available at each site. Site captains are to note any deficiencies and to report accidents/incidents.</li> <li>3.27 Site captains shall see that potential safety hazards (including fire) are identified and abated, and to develop site-specific emergency communication protocols and evacuation procedures which are to be posted in a prominent place.</li> <li>3.28 Investigators should travel and conduct fieldwork in pairs for safety.</li> <li>3.29 Articles of bright clothing (blaze orange, red, or white) should be worn in the field to identify yourself as a non-game species. Legal sustenance harvest, licensed hunting and poaching are common in all BOREAS operating areas, yearround.</li> </ul>
Fire Protection	<ul> <li>3.30 Site Captains are to ensure that their site has adequate fire protection.</li> <li>3.31 Forest Fire hazard condition reports by provincial authorities should monitored and investigators aware of any prohibitions. Exercise care at all times, even the hot exhaust pipes of a parked car can ignite dry fuels.</li> <li>3.32 Any suspected smoke sources spotted in the forest should be reported to the Provincial and National Park authorities without delay.</li> <li>3.33 Investigators are expected to arrive in the field fully prepared for work</li> </ul>
sufficiency & medevac procedures	with minimal or no support. The boreal forest is a wet, cold, buggy place abounding in creatures sharp in tooth and claw, so dress accordingly. All investigators shuld read and carry a copy of the BOREAS Medevac Procedures.

#### 4.0 ACCESS TO PRINCE ALBERT NATIONAL PARK

Parks Canada appreciates and supports the efforts of BOREAS investigators towards understanding the functioning of boreal ecosystems. The privilege to study undisturbed protected ecosystems comes at a cost: the responsibility to ensure that BOREAS activities do not compromise national parks values. Parks Canada has undertaken the unprecedented step of amending park land use zoning to accommodate study site development and access. Consequently Parks Canada credibility is at issue with stakeholders, including the broader research community. BOREAS Investigator deportment and example will have direct bearing on future research opportunities in Canadian national parks. Permit 4.1 Principal investigators or BOREAS staff conducting research within the requirement national park must hold a valid *Research and Collection permit* authorized by the park superintendent, and comply with permit conditions. Contact Mary Dalman to obtain one in advance. 4.2 Permit holders are responsible for the conduct of their field parties and compliance with park regulations. 4.3 Any change in the scope of the research proposal or location(s) of work as specified in the research permit must be approved by the park superintendent and the permit amended accordingly. Access: 4.4 The locked gate at the Fish Lake trail juncture with gravel highway 240 **Fish Lake** regulates site access to ensure infrastructure security and experiment integrity. trail (5.5 km) The Fish Lake trail is open to the public for wilderness hiking /cycling /skiing/ equestrian experiences. 4.5 Vehicle access is restricted to BOREAS investigators and staff with permits. Vehicles are not permitted on the Fish Lake Trail beyond the ATV trailhead. 4.6 The gate is to be kept locked at all times. Keys are available through the Site Manager (PANP). 4.7 The speed limit at all times is 15 km/hr. 3.8 Respect the rights of self-propelled wilderness travellers: vehicles shall yield the right of way at all times. When encountering equestrian users, passenger vehicles shall pull off to the side of the trail and shut off their engine, to allow the horse(s) to pass, before continuing. 4.9 The Fish Lake trail may be temporarily closed to motor vehicle access under some circumstances, including extended wet summer weather or spring thaw causing very soft surface conditions; or when winter snowfall accumulation is suitable for ski trail tracking. 4.10. Winter use is restricted to ski travel, unless authorized by the site manager

to transport equipment.

4.0 ACCESS TO	O PRINCE ALBERT NATIONAL PARK (continued)
Parking	4.11 Parking is permitted along the edge of the Fish Lake trail and at the gravel pit located 500m south of the Foot/ATV trail head.
	4.12 No parking is permitted within 10m of the Foot/ATV trail, to allow for unloading.
	4.13 A designated vehicle turn-around is to be used.
Foot/ATV	4.14 No passenger vehicles permitted on this trail under any circumstances.
trail (1.5 km)	4.15 Foot travel is the primary and preferred access.
	4.16 4-wheel ATV may be used to transport bulky or heavy equipment if required.
	4.17 Provincial law requires the use of helmets for ATV or over-snow machines
Camping	4.18 Camping is not permitted at the Aspen flux site. Measurements requiring overnight use of the site must be registered in advance with the Site Manager.
Aircraft	4.19 Low level flights should be minimized particularly on weekends, and avoid
overflights	developed areas including picnic and campgrounds at Waskesiu Lake and
    Firearms	townsite, and Namekus, Trappers and Sandy Lakes. 4.20 Firearms are not permitted under any circumstances.
	1.20 Thearns are not permitted under any chedinistances.

# **Appendix I: BOREAS Auxiliary Site Directions**

Site ID	Species	Age Class	Productivity Class	Directions (road distances are imprecise - see text)
Q1V2M	Mixed	??	Low-High	From int. of Rt.391 and Rt.375 go 23.6 km S on 375 to tie-in- pt; 100m @ 77° to pt. 1; 100m @ 77° to pt. 2; 100m @ 77° to pt. 3; 100m @ 77° to pt. 4.

# Appendix J BOREAS Modeling Contributions

BOREAS Model Intercomparisons Plan April 10th 1994 Joseph C. Coughlan and Steven W. Running

1. Background: At the February '94 Modeler's Meeting in Missoula, the BOREAS modelers agreed to run their models with data for five community types representing the tower flux sites at the NSA (North Study Area) and SSA. The plan is to run all models with identical initial values and boundary conditions and drive them with identical climate data. Both archived climate data and a set of prescribed site conditions likely to be measured at the tower flux sites will be provided to the BOREAS modelers. Site parameters, their values and selected output data for model comparisons are tabulated in this document. The climate data for the SSA and NSA is recorded at a hourly time resolution (from the airports) and the data will be arithmetically averaged into daily and monthly sets and made available in April. The quality of the climate data is still unknown but the list of data fields and their units are posted in this document. The site conditions are estimated from literature and field expeditions to the tower sites.

The objectives of the intercomparison exercise are: 1) compare simulation results of participating terrestrial, hydrological, and atmospheric models over selected time frames; 2) learn about model behavior and sensitivity to estimated boreal site and vegetation definitions; 3) prioritize BOREAS field data collection efforts supporting modeling studies; 4) identify individual model deficiencies as early as possible; 5) present the model comparison results at the BOREAS modelers meeting near IFC-2 and a final report to the BOREAS modelers meeting during the November '94 meeting.

2. For the modeling workshop in Missoula (Feb. '94) the following group representatives presented their modeling plans for BOREAS.

- 2.1 Terrestrial: Running, Frolkin, Coughlan, Knox, Ojima, Nikolov, Collatz, Prince and Price
- 2.2 Hydrology: Band, Lettenmaier, and Ek,
- 2.3 Atmospheric: Pielke, Lee, and Dickenson
- 2.4 Additional modelers, R. Cuenca, D. Baldocchi and D. Verseghy are participating.

3. For organizing and planning purposes, each group identified in section 2 (above) should submit the following items to Steve Running and Joseph Coughlan:

- 3.1 Model name, brief model description, (with citation if one is not in the modeling compendium) and a person of contact. This individual might be the person generating the model output.
- 3.2 Temporal resolution that the model will be run in the exercise: both time frame and step (see Table 1).
- 3.3 Required climatic variables for running the model.
- 3.4 Community type parameters needed for the model (see Table 2).
- 3.5 Output your group will submit for comparison to other models (see Table 1). Both time frame (i.e. annual) and time resolution (i.e. daily, or monthly).

The context for all the information requested is defined by the model intercomparison exercise. Model information extraneous to the exercise is not necessary. If there is any missing site parameter, unacceptable parameter value (Table 2), or unacceptable algorithm generating a data value then please mail an addition / correction to Steve Running & Joseph Coughlan as soon as possible.

4. Table 1. Model comparison matrix

Model Comparisons will be made with the data in Table 1. for the selected time frames listed in the Table. No model is expected to fill all the data in this table. The comparison data also coincides with field measurements collected during the IFC's for model validation. The modelers will provide the data in Table 1 for the time frames of interest. Data should be submitted in the appropriate time resolution and units.

The categories for data comparisons in Table 1. are energy / power, water, and carbon. The time categories are "golden" or selected days (hours, daily total) monthly (daily, monthly total), annual (daily or monthly and annual total). For now, year totals are defined by calendar and not water years.

	I I I I I I I I I I I I I I I I I I I					
	Annual	Monthly	Selected Days#	Other		
Energy	Latent and Sensible	Latent and Sensible	Diurnal Cycle	Diurnal Cycle		
Water	E, T Runoff	E, T delta theta	E, T, R, Theta, Snowmelt Groundthaw theta Avg.			
Carbon	NPP Soil Resp	NPP Respiration	Net CO <sub>2</sub> exchange			

 Table 1. Model comparison matrix

The units for data in Table 1 are: Energy Jm<sup>-2</sup> and Power Wm<sup>-2</sup>. Water (with snow in SWE) mm for 1-D and m<sup>3</sup>ha<sup>-1</sup> for volume; hydrologic budget in 1-D units. Carbon flux (gas) mmole  $CO_2$  m<sup>-2</sup> (methane flux?), mg ha<sup>-1</sup> of C for biomass. Mass of Carbon (leaf, stem, root, litter, and etc.) is C only, not wet or dry weight biomass - dry weight is carbohydrate and convert to C with molecular weight. See comparison time frames/steps in Table 1 for reporting measurements: hour, day, month or year. Label respiration: maintenance, growth, autotrophic and/or etc. Identify productivity as canopy net after maintenance respiration costs are deducted and/or d\_growth after allocation and growth respiration-soil surface (over and understory).

5. Table 2. Model Parameter Value Matrix

The follow parameter list should be used by all modelers. Not all model parameters will be in this list and not all models will use all the data. If there is a critical variable missing which is common to a class of model then please define and mail in the parameter and its initial value(s). Again, if there are suspect or inconsistent values/assumptions then contact Running and Coughlan. Fen and Peat soils still need data values.

# Table 3. Thermal properties of soils and snow (Wijk and Vries 1963; as byHillel, 1982).

5.2 Additional soil properties: hydrologic. Sand:

```
\Psi_{\rm S} = 12
       K_s = 0.002 cm s<sup>-1</sup> (k<sub>s</sub>=hydrolic conductivity at saturation)
        porosity=40% void
       b= 4 (constant from Clapp and Hornberger 1978)
Clay (sandy clay):
       K_s = 2.17*10^{-4} \text{ cm s}^{-1}
        porosity = 40\% void
        \Psi_{\rm S} = 15
        b = 10
Peat
        K_s = n/a
       Porosity=80% void
        \Psi_s = n/a
        b = n/a
Peat deeper clay-sand-loam (20cm):
       K_s = 0.00063 \text{ cm s}^{-1}
       Porosity = 40\% void
        \Psi_{\rm S} = 8.5
        b = 7
FEN use peat soil and see below
```

Soil Equations:

 $\Psi(W) = \Psi s^* (W^{-b})$ where: W = soil water content = vol/vol total b = constant from Clapp and Hornberger 1978 K(W) = K\_s^\* Wc where: c = 2b + 3

5.3 Operational methods for Soil / Hydrology Model Initialization: Start the model on September 1st with initial data. Assume that the soils are at 50% field capacity (with an even distribution of water) on September 1 and the soil temperature at the surface layer is the average air temperature for the month of September and the temperature at the damping depth is the average air temperature for the year. By January, snow will accumulate and soil moisture may begin to differ, however, these differences are due to the models and not to different data.

Soil Temp (see Table 5a for climate data summaries) at surface Mean monthly temp. for initial month at damping depth Mean annual temp.

Fens will have saturated soils. For computing the Fen soil's thermal properties and assumptions refer to LaFleur and Rouse (1990, Ag. For. Met. 135-153) Pages 141 and 142. Also refer to Table 3 in this document.

Wet conifer will have a 20 cm peat layer beneath the moss. Below that peat layer is a clay-sand-loam soil. For models with a single soil layer use a clay-sand-loam definition.

6. Climate Data Description

We have a year's worth of hourly data starting Jan 2 (1989) from Thompson and Prince Albert airports.

Table 4a. Parial list of climate data fields and units form both Thompson (th) and Prince Albert (pa) Airports.

Hourly data.

Mo - Month, Da - Day of Month, Hr - hour Psea - sea level pressure (mb) Td - dew point (degrees C) Vs - Wind speed (Km/h) P - Station pressure (mb) T - Temperature (degrees C) Cloud - Cloud cover in tenths DD - wind direction (10 degree intervals) U - wind component V - wind component q - mixing ration (g water /kg dry air) LW - Total Longwave (W m<sup>-2</sup> hr<sup>-1</sup>, computed ) SW - Total Shortwave (MJ m<sup>-2</sup> hr<sup>-1</sup>, computed )

Table 4b Daily data.

Mo - Month DOM - Day of month SAM - Station acronym month D - Day Tmax - Daily maximum temp, (degrees C) Tmin - Daily minimum temp, (degrees C) Rain - Total rainfall (mm) Snow - Total rainfall (mm) Snow - Total snowfall (cm) Precip - Total precip (mm) Grnd.Snow - Snow on ground (cm) Trange - temperature range X - cumulative 10 day intervals) LW - Total Longwave (W m<sup>-2</sup> day<sup>-1</sup>, computed ) SW - Total Shortwave (MJ m<sup>-2</sup> day<sup>-1</sup>, computed )

Shortwave is estimated using an hourly time step results summed for the day (Running et al. 1987). Daily atmospheric transmissivity is computed with the air temperature amplitude method from Bristol and Campbell (1984). The specifics are too long to include in this document.

Longwave is estimated with the method in Heitor et. al (1991) Agric. and For. Met. 54:29-48. The daily LW estimate is made with 24 hour average inputs (from the hourly data). Hourly LW were computed with the hourly data.

Lw =  $e * 5.67*10^{-8} * Tak^4$ where Lw - incoming thermal radiation (W/m<sup>2</sup>) 5.67e-8 - S-B constant (W m<sup>-2</sup> K<sup>-4</sup>) e - atmospheric emissivity (dimensionless)

e = (0.6 + 0.048 \* Ea<sup>0.5</sup>) \* (1 + 0.23 \* N) where 0.6 - Clear-sky atmos. emissivity in the absence of water-vapor, at screen height (non-dimensional) 0.048 - coefficient (hPa<sup>-0.5</sup>) 0.23 - coeff. (dimensionless) N - fractional cloud cover (dimensionless) Ea - atmos. water vapor pressure (hPa).

All climate data will be placed on anonymous FTP on BORIS in the raw form, corrected, and temporally aggregated along with aggregation methods. Some summary climatic and simple moisture balance information is below in Tables 5a and 5b.

Table 5a. Physical and long term climatic data from the airport meteorological stations.

# **Appendix K: Measurement Methodologies**

## Hemi-Surface Area Definition

The most desirable foliage area to use in reporting results from conifer shoots and broad leaves is to use one-half the total surface area, which we shall refer to as Half the Area of the Surface of the Leaf (HASL). For flat leaves the hemi-surface area is the same as the projected area, but for conifer needles or shoots "projected area" is not even well defined and generally not used consistently. Hemi- surface area is not easy to misinterpret for any object.

Hemi-Surface Area Measurement

Surface area for conifer shoots can be measured by several methods, but the two most common are volume displacement and projected area of detached needles using an optical planimeter.

Using the optical planimeter is tedious because needles have to be carefully aligned so as to present their maximum area to the planimeter. Given the measured needle projected area of all the needles that have been detached from the shoot and a known cross sectional shape for the needles, the surface area can be calculated and divided by two to get HSA.

A faster method that is as reliable as the planimeter method and does not require an expensive optical planimeter is the VOLUME DISPLACEMENT METHOD. This method requires a reasonably good, top-loading electronic balance; something common to any lab. The procedure is as follows:

1) A container that is large enough for an intact shoot to be submerged in is filled with water and about 3-5% detergent mixed in with the water. The detergent is necessary because it prevents small air bubbles and films from accumulating on the surface of the shoot. The container has to be large enough for the shoot to be submerged without touching the walls of the container. If shoots are too large, needles can be detached and submerged in the container using a fine wire.

2) The container and liquid are placed on a top loading electronic balance and tared to provide a zero reading. An intact shoot (or a group of needles from a shoot) is submerged in the liquid with out touching the walls of the container and the weight recorded. To push the shoot into the water a force equal to thebuoyant force must be applied. The buoyant force is related to the mass of the volume of water displaced by the shoot. Thus, the volume of the intact shoot (V) in cubic centimeters is numerically equal to the weight increase indicated on the balance.

3) The number of needles on the shoot (n) are counted and their averaged length (L) determined from a subsample of 10 to 20 needles spaced over the length of the shoot.

4) For precise work, the needles can be removed from the shoot and the volume of the woody portion of the shoot measured by submerging it in the liquid-filled container on the balance. The needle volume is the difference between the total volume and the woody volume. The volume of the woody portion is generally 5 to 15% of the total volume.

5) The shape of the cross sectional area is determined from observations under a microscope. This shape is usually fixed for all needles of a given species and so has to be determined only once for a given species. This shape determines the coefficients in an equation that relates the above measurements to surface area (SA).

The total surface area (SA) of a group of conifer needles is given by: 1) SA = nLP

where n is the number of needles, L is their mean length and P is the length of the perimeter of the needle cross section. The volume of the needles is: 2) V = nLA

where A is the needle cross section. Solving for A gives: 3) A = V/(nL).

We can define a dimensionless "shape factor" X: 4) X = P/sqrt(A)

thus

5)  $P = X \operatorname{sqrt}(A)$ .

Substituting this into 1) gives: 6) SA = nLX sqrt(A)

and from 3): 7)  $SA = nLX \operatorname{sqrt}[V/(nL)] = X \operatorname{sqrt}(VnL).$ 

This equation is valid for any arbitrary cross-sectional needle shape. Moreover, the factor will remain constant even if the needle tapers at its end, provided its shape remains the same.

Shape	Equation	Species
Square	SA = 4.00 sqrt(V n L)	Spruce
Ellipse (1:3 ratio of axes	SA = 4.17 sqrt(V n L)	Douglas-Fir
Cylinder	SA = 3.54  sqrt(V n L)	
Hemi-Cylinder	SA = 4.10  sqrt(V  n L)	Black Pine
Rectangle		
(width=length/10)	SA = 6.96  sqrt(V  n L)	
(width=length/4)	$SA = 5.00 \operatorname{sqrt}(V n L)$	
(width=length/3)	SA = 4.62  sqrt(V  n L)	
(width=length/2)	SA= 4.24 sqrt(V n L)	

Note: sqrt means square root of the quantity in ().

Careful measurements of total surface area were done on several species by both the volume displacement method and optical planimeter method.

Species	<b>Optical Planimeter (mm<sup>2</sup>)</b>	Volume Displacement (mm <sup>2</sup> )
Blue Spruce	3276	3216
Douglas-Fir	9990	9705
Black Pine	4084	3900

With Douglas Fir, if detergent was not added to the water, the Volume displacement method overestimated the surface area by 35% in one case and 39% in a second case because of entrapped air.

HSA is just one half the total surface area.

Proposal: Investigators using the volume displacement method should report total and half surface area (SA and HSA, respectively) along with the shape factor (X). A description of the method used to calculate the shape factor should also be provided.

#### EXPLANATION OF PROGRAM CODES

Synoptic observations Sv.

X - surface weather observations in a numerical code based on WMO regulations, and exchange worldwide.

H - observations as above taken by an automatic station.

н Hourly weather

hours

X - 24 hours per day.

B - 8 observations per day, taken every 3

C - 4 observations per day, taken every 6 hours.

D - irregular observations, daily.

E - 8 observations per day, taken every 3 hours, plus extra hours.

F - 4 observations per day, taken every 6 hours, plus extra hours.

G - automatic station (various types) irregular, daily.

H - automatic station (various types) 24 hours per day.

J - irregular observations, not processed,

Т Temperature

X - daily readings of maximum and minimum temperature (°C)

Ρ Precipitation x - daily values of liquid, freezing or frozen precipitation (mm)

Rate of Precipitation X - tipping bucket rain gauge, hourly rainfall values and rate of rainfall (mm) S - Fisher and Porter precipitation gauge. quarter hourly values and rate of precipitation (mm) B - both X and S.

W - weighting type precipitation gauge

(mm)

V - volumetric precipitation gauge, periodic measurements (mm)

w Wind

B - data processed from 45B autographic record, hourly total wind run in km/h and direction to 8 compass points

U - data processed from U2A autographic record, hourly (short duration mean) wind speed in km/h and direction to tens of degrees.

Soil Temperature So

D - morning values recorded for depths: 5, 10, 20, 50, 100, 150, and 300 cm (°C); and

afternoon values for the first three depths only. G - same as D but from an automatic recorder.

Ε Evaporation

A - net water loss from pan and calculated lake evaporation (mm), type A pan, daily values. R - type A pan, daily values using

radioactive tracer (for Atomic Energy of Canada).

Su Sunshine

R - hourly values of bright sunshine from an electronic recorder.

S - hourly values of bright sunshine.

R Radiation

radiation values are recorded hourly in Local Apparent Time and the units are expressed in megajoules per square metre, except daylight illumination is in 1000 lumen-hours per square metre,

- A global solar radiation RF1.
- B sky radiation RF2.

C - reflected solar radiation RF3.

D - net radiation RF4.

E - daylight illumination RF7

- F A + B
- G-A+C
- H-A+D

J-A+B+C K-A+B+C+D L-A+C+DM-A+B+C+D+E N-A+B+D

0 Ozone

T - total ozone and umkehr observations using Dobson spectrophotometer, daily in m-atmcm and umb units respectively.

S - ozonesonde on a weekly basis (usually Wednesday) in umb units.

O - T and S.

Upper air

U

Т

Ν

X - rawinsonde (temperature, pressure, humidity and wind)

W - wind only.

T - radiosonde (temperature, pressure and humidity)

Sn Snow Survey

V - 5 points, 30 m apart, on the 1st, 8th, 15th and 23rd of the month.

X - 10 points, 30 m apart, taken on the 1st and 15th of the month.

Tower.

А Air Quality

T - Turbidity, observations of total aerosol content at 09, 12, and 15 LST on cloudless days. A - Canadian Air and Precipitation Monitoring network (CAPMoN). C - precipitation chemistry. B - T + C. P - particulate sampling.

G - gaseous sampling.

- H-T+C+P
- J-T+C+P+G

Nipher - snow water equivalent (mm),

## Appendix M: Traditional Land Use Map and Calendar

BOREAS WORKSHOP Winnipeg, Manitoba May 26-28, 1993

### TRADITIONAL LAND USE MAP AND CALENDER Nelson House Land and Resource Use Study The MKO Natural Resources Secretariat

#### 1.0 Background

In 1992, the Natural Resources Secretariat of the Manitoba Keewatinowi Okimakanak, Inc. (MKO) was contracted to document and determine the type and extent of land use by Nelson House First Nation members within the BOREAS study area. The MKO represents the 25 northern-most First Nations in Manitoba which can generally be described as extending north of the 53rd parallel covering some two-thirds of the province. The Nelson House First Nation is a member of the MKO.

The Natural Resources Secretariat conducted the <u>Nelson House First</u> <u>Nation Land and Resource Use Study</u> which documents the spatial and temporal aspects of traditional resource use activities of Nelson House First Nation members in the BOREAS study area. The final report of this study is in the process of being assembled but the land use map and calendar are presented and explained here so it can be utilized as part of the present workshop.

2.0 Traditional Land Use Map

The BOREAS study area is located entirely within the traditional territory and resource area of the Nelson House First National (NHFN). Therefore, the entire area utilized by BOREAS is used, inhabited and occupied by members of the NHFN both historically and presently.

The traditional resource harvest activities of twelve members of the NHFN within the BOREAS study areas were recorded through seven map biography interviews (attached map). The land use information recorded in the map as provided by the informants does not cover the entire area of the supersite. This does not mean that the areas with no land use information are not used for traditional pursuits but rather, it means that more interviews need to be conducted with other members of the NHFN who use the area. The land use map depicts the spatial distribution of land use by the informants from the NHFN in relation to the spatial distribution of the BOREAS activities. The information in the map also shows that the BOREAS study area is extensively used by the twelve informants from the NHFN.

The traditional resource harvesting activities and sites depicted by the map include the following:

Yellow lines - Trapping Blue lines - Hunting Green lines - Fishing Red areas - Berry and Plant Gathering Red triangle - Campsites Black square - Cabins

The BOREAS study sites (within the supersite) in the form of towers and other manmade features of the area such as the highway and transmission line are also included.

The supersite includes a section of the Sapochi River and numerous creeks which are important to traditional harvesting activity by the NHFN. The supersite and the extra study site also contain trails and sites established and used by members of the NHFN while in pursuit of traditional resources and activities.

The types of resources and the seasons during which they are harvested are presented by the discussion of the land use calender in the next section.

#### 3.0 The Land Use Calender

The land use calender depicts the type of uses which occur throughout the study area during various seasons throughout the year. It also depicts the type of resources which are harvested (attached calender). The resource harvest activities depicted by this land use calender are as follows:

- Trapping
- Hunting
- Fishing
- Berry and Plant Gathering
- Timber Cutting
- Egg Collecting

The land use calender will be described by the activities mentioned above in the order they appear and the resources which are harvested.

### 3.0.1 Trapping

Trapping for fur bearing animals occur throughout most of the year from about the month of October to May but for different species. The different time periods and the different species of fur bearing animals harvested is presented in the following:

#### Beaver, Otter and Muskrat

Trapping for beaver and otter occurs from the month of October to the end of May (late fall, winter and spring). From about the month of March to May (spring), the harvest of beaver and otter is combined with the harvest of muskrat.

#### Mink, Fisher and other Species (ie. Marten, Wolf, Fox, Lynx)

These species are harvested from the month of October to February (late fall and winter). The harvest of lynx is combined with the other species during the months of January and February (winter).

Rabbits snaring occurs throughout the year for food and not for the value of the pelt. This list is not an exhaustive list but is a good representative sample of the time periods and the species harvested as provided by the informants.

#### 3.0.2 Hunting

Hunting for different species of animals and waterfowl occurs throughout the year. The spring and fall seasons are peak seasons for hunting. The following are some of the species of animals and birds hunted throughout the year.

#### <u>Waterfowl</u>

With the onset of spring and the return of waterfowl from their wintering grounds, ducks and geese are hunted. This period ranges from mid-April to the end of May or mid-June.

The other time when waterfowl are hunted is during the fall season during the southern migration. This period ranges from late August to mid-October.

### Moose and Woodland Caribou

The moose hunt in the fall season is a very important annual event because the rutting season makes it favourable to hunt this animal. This period extends from about the month of September to early November. But moose can be hunted year-round, wherever possible.

Woodland caribou are hunted mostly during the fall and winter seasons. The woodland caribou species have not yet been incorporated into the land use calender but are a species which are hunted.

Small game species such as rabbits and grouse or spruce hens are hunted yearround. The periods mentioned here are the favourable times to hunt for all species but if other opportunities exists during the year, then hunting will occur. For example, if a moose is spotted during the winter, then it will be hunted.

#### 3.0.3 Fishing

Fishing with a net under the ice can occur anywhere between the month of November after freeze-up to the end of April. Angling can occur anywhere between the month of May, after the ice thaws, and the end of September. The species harvested by angling include mostly jackfish (northern pike) and walleye. The domestic species (traditional net fishing) also includes whitefish in addition to the previously mentioned species. Suckers and burbot are also caught in the nets but are not eaten.

#### 3.0.4 Berry and Plant Gathering

Both berry and plant gathering occurs during the growing season. Berry picking occurs during the months of July and August after the berries have ripened. Referring to the land use map presented and discussed earlier, the red areas along the highway are berry picking areas. The type of berries include raspberries, cranberries and blueberries, among others.

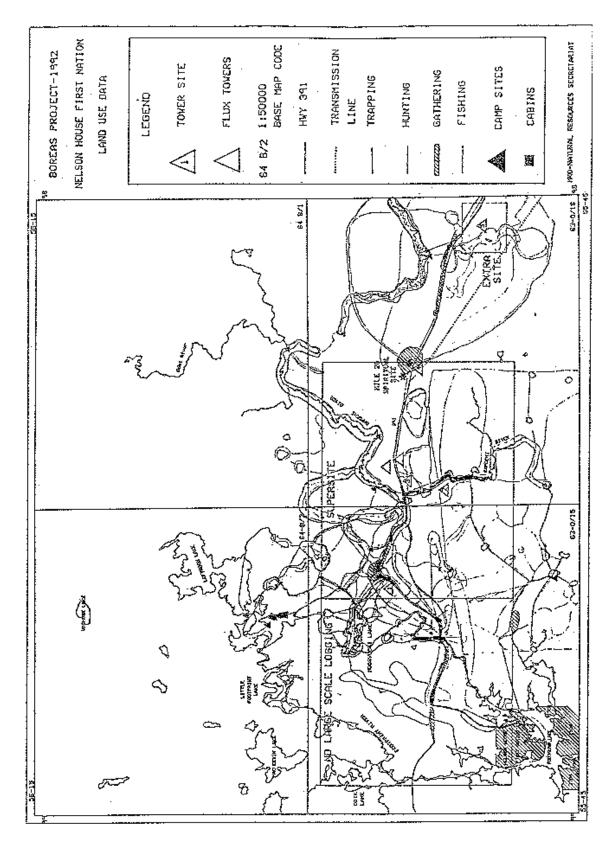

Wild mint and other plants are gathered within the BOREAS study site during the growing season from about the month of June to about the month of august or September.

#### 3.0.5 Timber Cutting

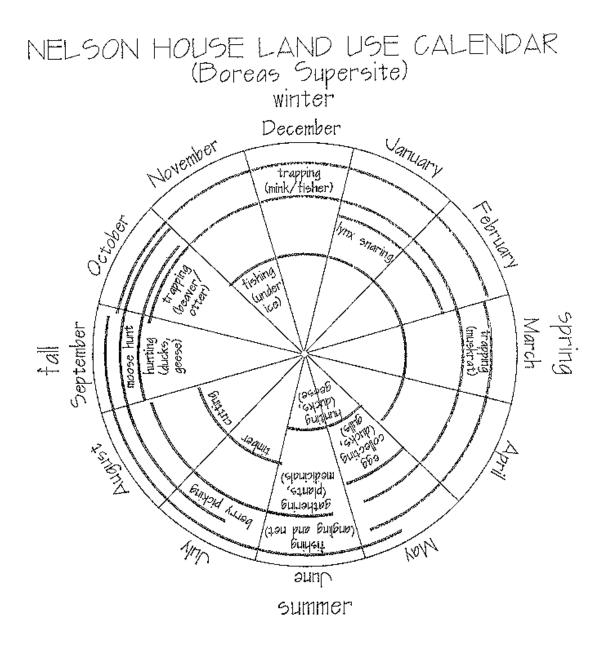

Timber cutting for firewood occurs year-round but the peak period is during the fall season in preparation for the oncoming winter. Timber cutting for cabins occurs during the months of July and August.

## 3.0.6 Egg Collecting

Egg collecting from duck and seagull nest sites occurs during late May to early June.

Highway 391 and hunting, fishing, and trapping lines cannot be distinguished in black and white. Color copies of this map may be requested through BORIS.

P.I.(s): CO-I(s):	Crawford, T./NOAA Baldocchi, D., Meyers, T., McMillen, R./ NOAA
Title:	Experimental and Modeling Studies of Water Vapor, Sensible Heat, and CO <sub>2</sub> Exchange Over and Under a Boreal Forest
Objectives and Approach:	We propose to measure and model air-surface exchange rates of water vapor, sensible heat, and CO <sub>2</sub> over a boreal forest, and to study the abiotic and biotic factors that control the fluxes of scalars in this landscape. Scalar flux densities will be measured with aircraft-borne eddy correlation flux measurement systems. Spatial variability of surface fluxes over the boreal forest landscape will be measured with an airplane-mounted eddy flux system. The airplane-mounted flux system will also ascertain the significance of edges and advection on the scaling of mass and energy fluxes from points to regions. Core Measurements include the mass and energy exchange studies just described, as well as measurements of meteorological variables. A hierarchy of single and multi-layer mass and energy (water vapor, heat, and CO <sub>2</sub> ) exchange modelsbased on Eulerian and Lagrangian frameworks and on micrometeorology, radiative transfer, plant physiology, and biochemistry theorywill be developed and tested using the data obtained over a boreal forest. Comparing the hierarchy of models will enable us to rank the controlling variables and to develop a simpler surface exchange model that can be used by climate and ecosystem models. Our final goal is to drive the simple model with satellite-derived land-use data and meteorological information to evaluate the spatially-integrated surface fluxes.

#### Ref. Number AFM-2

P.I(s).:	Kelly, R./Univ of Wyoming, Lenschow, D./NCAR
Title:	Airborne Investigation of BiosphereAtmosphere Interactions Over the Boreal Forest
Objectives and Approach	We propose to carry out a program of airborne investigations using the University of Wyoming King Air (Kelly) and the NCAR Ellectra (Lenshow), The King Air will be used to measure fluxes of latent and sensible heats, momentum, and CO <sub>2</sub> . Other measurements include up- and down-welling radiation, and cloud microphysics (cloud droplet spectra and liquid water content). The Electra and King Air flight patterns will be coordinated with other aircraft and with the surface network, and will be carefully designed to provide adequate sampling statistics and evaluation of horizontal variability. The data will be used to calculate fluxes and other statistical variables, as well as spectral and cospectral variables. Analysis objectives (King Air) fluxes, profiles, and budgets for sensible and latent heat and CO <sub>2</sub> estimates of surface fluxes error analysis conditional sampling floutes of clouds on fluxes, profiles, budgets spectral and cospectral analysis of variability

#### Deliverables

- pass-by-pass compilation of mean, variance, skewness, and horizontal gradients
- -- eddy momentum fluxes (x, y, and z)
- -- vertical fluxes of momentum, sensible and latent heat, and CO2
- extrapolation estimates of surface fluxes of momentum, sensible and latent heat, and CO<sub>2</sub>

Needs from other groups

- -- all surface and canopy height fluxes
- -- all surface radiation measurements

Needs from project staff

- -- forecasting
- -- cloud-cover documentation (satellite, all-sky cameras)

#### Ref. Number AFM-3

- P.I.(s): Lenschow, D./NCAR, Kelly, R./Univ of Wyoming Title: Airborne Investigation of Biosphere--Atmosphere Interactions Over the Boreal Forest Objectives We propose to carry out a program of airborne investigations using the NCAR and Electra (Lenschow) and the University of Wyoming King Air aircraft (Kelly). Approach: The Electra will be used to measure fluxes of latent and sensible heats, momentum, and CO<sub>2</sub>, as well as other trace gas species, and mean concentrations of species for which sensors for flux measurements are not available. Other measurements include up- and down-welling radiation, vegetation-sensitive radiation for estimating the NDVI, cloud microphysics (cloud droplet and aerosol spectra and liquid water content), lidar measurements of cloud base and BL depth, and possibly remote Doppler air velocity. The Electra and King Air flight patterns will be coordinated with other aircraft and with the surface network, and will be carefully designed to attempt to provide adequate sampling statistics and evaluation of the effects of horizontal variability of surface variables and cloudiness. The data will be used to calculate fluxes and other statistical variables, as well as spectral and cospectral variables. Deliverables (focus on transects between NH and PA) pass -by-pass compilation of mean, variance, skewness, and horizontal gradients eddy momentum fluxes (x, y, and z)vertical fluxes of momentum, sensible and latent heat, and CO<sub>2</sub> Needs from other groups all surface and canopy height fluxes
  - -- all surface radiation measurements
  - -- model predictions of fluxes

#### Needs from project staff

- -- logistical assistance for basing in Saskatoon and Churchill
- -- good communications between Saskatoon and PA and NH sites

- -- laboratory/office space at Saskatoon for computer and chemical equipment (possible coordination of Univ, of Saskatoon?)
- -- forecasting
- -- cloud-cover documentation (satellite, all-sky cameras)

Title:	Areal Estimates of Mass and Energy Exchange from a Boreal Forest Biome
Objectives and Approach:	Aircraft are the most promising means to bridge the gap between local scale tower measurements and regional scales. The proposed research will focus on developing various techniques to obtain large area flux estimates of mass and energy using the aircraft-tower and spectral data combination. Measurements recorded along a transect between PA and NH sites will be used to characterize the spatial variations of canopy conductance and determine its usefulness for inferring mass and energy exchange of relatively important trace gases (CO <sub>2</sub> , O <sub>3</sub> , etc.). Covariance analyses will be used to improve relationships between trace gas exchange and spectrally derived surface features. Joint observational methods between aircraft will also be developed to arrive at more accurate estimates of regional fluxes including a program for aircraft intercomparison.
	<ul> <li>Deliverables</li> <li>evaluation of several techniques to obtain large area flux estimates</li> <li>comparison of coherent structures of mass and energy transfer between aircraft and tower data in order to define better criteria for aircraft sampling</li> <li>development of algorithms relating trace gas measurements by aircraft based sensors to spectrally derived surface features</li> </ul>
	Needs from other groups comparison of measuring techniques and standards information on sky condition (cloud cover, primarily)
	Needs from project staff satellite data

P.I.(s): Atkinson, B./Env. Canada

Title: Upper-air Measurement Program.

Objectives<br/>andTo provide sufficient definition of the atmosphere on a broad<br/>scale for scientific research, by supplementing the existingApproach:Atmospheric Environment Service (AES) aerological network, both<br/>temporally and spatially. Sponsor additional flights at existing AES<br/>aerological stations Churchill, The Pas, and Saskatoon, to three per day<br/>during IFCs. Sponsor additional flights at existing AES aerological station<br/>Saskatoon to 2 per day during FFC-T. Sponsor additional flights at existing<br/>DND aerological stations Primrose Lake and Shilo to 2 per day during IFCs<br/>and FFC-T. Sponsor flights by a co-operating agency (NASA) at Lynn Lake<br/>during parts of IFC-2 and IFC-3.

Establish 3 additional aerological stations, with communications, at Thompson MB, Candle Lake SK, and Key Lake SK. Contract people to operate these stations, and train them. Assure that observations are being made according to established procedures. Assure that observations are reaching national and international communications in real time. During FFC-T, these stations will release 2 flights per day. During IFCs, these stations will release 3 flights per day, and Thompson and Candle Lake will, on selected days, release 7 flights per day. Refer to Table 3.2.2.

Assure that data from all flights, regularly scheduled and BOREAS sponsored, reach NHRI (Dr. Barr) to be reprocessed before being sent to BORIS.

Field Measurements:

In the vertical, at fixed and significant levels, to at least 100 mb, using the same makes of radiosondes as AES: temperature moisture wind speed wind direction geopotential height.

Supporting measurements: None.

Infrastructure needs:

From BOREAS: telephones for communication of data in real time. Arrangements have been made with AES Central Region to have an experienced upper-air inspector manage this network."

P.I.(s): CO. I(s):	Banta, R./NOAA Eberhard, W., Wilczak, J., Martner, B./NOAA
Title:	Outer-Boundary-Layer Effects on Surface Fluxes of Momentum, Heat, Moisture, and Greenhouse Gases from the Boreal Forest
Objectives and Approach:	Properties of the outer atmospheric boundary layer (OABL) and lower troposphere above 100 m will be measured using ground-based remote sensing instrumentation, including a UHF profiler equipped with RASS, a Doppler radar, and a Doppler lidar. The measured properties will include profiles of wind and turbulence quantities and temperature as functions of time from each profile, including gradients from the several stations. Lidar/radar scan data show the vertical structure and horizontal variability of wind, aerosols, and clouds. Scan data also reveal the eddy structure of the OABL. Profiles include mean horizontal wind and such turbulence quantities as turbulent kinetic energy and momentum flux. Aircraft data will complement our data sets very nicely. With this information we will perform integrated analyses of the surface and OABL. These analyses will enable us to determine appropriate controls on surface fluxes for subgrid parameterizations of these processes and for finding appropriate procedures to extend local estimates on fluxes to larger areal averages, such as satellite footprints. This information will be very useful in interpreting the behavior of surface fluxes from point measurements, especially as they relate to larger-scale fluxes, because of the strong interactions between the surface layer and the OABL. The profiler will operate near Nipawin tower cluster, if possibile during all three IFCs. The radar and lidar will operate during IFC-2. Deliverables -hourly profiles of horizontal winds from profilers -profiles of norizontal wind, TKE, momentum flux -time series of inversion height from all three instruments -cloud base heights Needs from other groups -comparisons with surface and tower measurements Needs from project staff -help in site selection preparation, including maps with topography and access roads for PANP, Nipawin PP, La Ronge, NH site; liaison to land owners/managers for access; help in site preparation, help in arranging line power service or generator fuel; advice on security needs;

P.I.(s):	Shewchuck, S./
Title:	Mesonet Meterological Data
Objectives and Approach:	The Saskatchawan Research Council, located in Saskatoon, will implement and maintain a meso network of nine (9) or ten (10) automated meteorological stations located in the Prince Albert and Thompson supersites and the intervening transect. Standard meteorological and radiation data will be collected and 30 minutes average values produced for BORIS. Some limited analysis of fields will also be available. This data will be available beginning in the fall of 1993 through the 1994 fall season.

P.I.(s):	Betts, A./ Atmospheric Research
CO-I.(s): Title:	Hollingsworth, T./European Centre for Medium Range Weather Forecasting Boundary Layer Research for BOREAS
Objectives and Approach:	The objective of this research is to understand the diurnal evolution of the convective boundary layer over the boreal forest. The approach will be to analyze surface, boundary layer and cloud data from BOREAS using simplified conceptual models, and prepare compacted data bases for comparison with large- scale models. The key contributions by the PI to BOREAS will be:
	1) To assist with the design of the surface and upper air networks, and the aircraft measurement program for BOREAS, and to optimize the boundary layer and mesoscale components of the experiment.
	2) To analyze the diurnal cycle of the BOREAS boundary layer, using surface, upper air, aircraft and cloud data using budget methods; paying careful attention to the coupling of surface radiation, evapotranspiration, boundary layer growth and cloud fields during the diurnal cycle, and over the seasonal cycle.
	3) To produce reduced data sets for the diurnal evolution of the boundary layer for the testing and improvement of the land surface and boundary layer climatology in both regional and global models.
	4) To coordinate with ECMWF, the production of post analysis products to describe the basic meteorological fields and the surface and boundary layer energy budgets on the mesoscale across the BOREAS experiment area.
	Needs from other groups time series data sets as input to models
	Needs from project staff input of surface and upper air data to the GTS for assimilation at ECMWF and NMC.

P.I.(s): Collaborator(s):	Dickinson, R.,/University of Arizona Shuttleworth, J.; Graumlich, L.; Bonan G.; Henderson-Sellers, A.
Title:	Incorporation of Boreal Forest Ecosystem Description into Climate Modeling Framework
Objectives and Approach:	An integrative modeling investigation will be conducted that would relate the BOREAS study to land process parameterizations of the Biosphere Atmosphere Transfer (BATS) for application in global climate models. The PI and graduate students will carry out modeling studies to establish the relative sensitivity of surface-atmospheric exchanges of energy, moisture and carbon to various parameters and processes for boreal forests, as defined through the PI and Core measurement programs and their analyses. The investigation will also use the results of BOREAS to improve the representation of boreal forests in the BATS code through better specification of parameters and improved process descriptions. The investigation has as its objective the synthesis of the BOREAS study into an improved understanding of the role of boreal forests in the climate system, both in terms of simple concepts and through implementation of better representations in global climate models.

Title:	Fluxes Over Inhomogeneous Surfaces in BOREAS
Objectives and Approach:	Aircraft data from the Wyoming King Air and the Canadian Twin Otter, and the NCAR Electra will be analyzed to compute fluxes of heat, moisture, momentum, CO <sub>2</sub> , and other chemical species . It is essential that sampling criteria are satisfied and the impact of surface heterogeneity is assessed before useful comparisons can be made between analyzed for sampling and heterogeneity problems in order to make recommendations for the 1994 field program. Immediately after the 1994 program, analysis of sampling problems and flux errors will be completed to provide estimates for BORIS. More detailed analysis of these errors will be continued. We will emphasize variations over inhomogeneous surfaces and estimates of spatially averages fluxes over regional scales. Using repeated flight legs over the same terrain and partitioning the flight track according to the greenness index and other indicators of surface conditions, the motion will be divided into turbulence and mesoscale motions. The latter are divided into motions associated with variations of surface conditions of the turbulent flux by the mesoscale motion will be computed and their influence on the area-averaged flux will be studied. This analysis will lead to values of fluxes over different types of vegetation. These results can then be compared with surface flux estimates.

N-9

evaluation of models of BL cloud cover and attenuation of solar radiation. This aspect of BL modeling is considered to be one of the most important deficiencies in global climate models.

#### Deliverables

- -- aircraft fluxes
- -- flux error estimates
- -- turbulence statistics
- -- surface energy budget for area-averaged flow

Needs from other groups

-- detailed flight plans for aircraft groups

P.I.(s): CO. I(s):	Pielke, R./Colorado State Univ Kittel, T./Colorado State Univ Loveland, T./USGS Steyaert, L./USGS Lee, T.J./Colorado State Univ
Title:	Modeling Biosphere Atmosphere interactions at Various Scales in Support of BOREAS
Objectives and Approach:	The objectives of our participation in BOREAS is to improve our understanding of the interaction between a heterogeneous sub-Arctic landscape and the overlying atmosphere. The Regional Atmospheric Modeling system (RAMS), a state-of-the- art numerical atmospheric model which includes sophisticated parameterization of vegetation and soils will be used for this purpose. Simulations with RAMS will be performed to develop an improved understanding of soil/vegetation/ atmospheric interactions and to develop a parameterization of heterogeneous landscapes for use in larger scale models (e.g., general circulation models-GCMs). We also will provide detailed simulations of atmospheric features at various spatial and temporal scales as requested by the BOREAS Science Team. The USGS will develop a land cover characteristic data base derived from the 1-km AVHRR and geographic information system capabilities to support the RAMS work. The USGS will develop a regional land cover characteristics database to support RAMS.

Title:	Analysis and Interpretation of Airborne Flux Observations Over the BOREAS Sites
Objectives and Approach:	<ul> <li>Much of the BOREAS information is obtained from local observations at or nearthe ground whose representativeness for the sites, let alone for the boreal system in this transition zone, must be established. This is particularly true for tower-based flux observations whose "footprint" (area which exerts a significant influence on the flux estimate) represents a vanishing small fraction of the overall area of the site.</li> <li>We will use Twin Otter flux aircraft observations to provide BOREAS investigators with site-wise and inter-site "mapping" of the exchange of momentum, heat, moisture, CO<sub>2</sub>, CH<sub>4</sub>, O<sub>3</sub> (and to a more limited extent nonmethane hydrocarbon) at specific moments in time. This will permit BOREAS investigators to place their local observations in a site-wide perspective and provide a starting point for the scaling up to truly regional estimates of transfer.</li> <li>Specifically, our study aims at:</li> <li>the definition of a realistic footprint function over the BOREAS sites, so that airborne observations are related to the correct ground surface with its biological and ecological characteristics.</li> <li>the statistical and structural analysis of coherent turbulence "events" that dominate transfer between forest canopy and atmosphere, in particular the relationship between transfers of momentum, heat and moisture with those of various trace gases, as a function of forest and boundary-layer characteristics.</li> <li>the response of transfer processes to changing radiation conditions induced by intermittent cloudiness.</li> </ul>

P.I.(s):	Sellers, P.J., Hall, F.G./NASA/GSFC, Nelson, A.K./USRA
Title:	Use of Biophysical Models and Satellite Remote Sensing to Quantify the Climate/Land-Surface Interactions Over a Boreal Forest Biome
Objectives	To use the photosynthesis and transpiration models (e.g., SiB of Sellers et al., BGC of Running et al., the model of Bonan et al.), in conjunction with remote sensing inputs of canopy process and biophysical parameters, landscape level disturbance and successional patterns to:
	(i) simulate changes in energy and water exchange as a function of climate change scenarios.
	(ii) simulate associated changes in growth rates and carbon storage associated with the successional stages in the boreal forest.

We will use the linked stomatal resistance-photosynthesis SiB model in the inverse-mode to calculate canopy photosynthetic capacities, bulk stomatal conductance etc., appropriate to each BOREAS flux site and compare the model predictions to tower measurements. The model will be used to calculate soil evaporation rates to separate the soil and vegetation contributions to the total observed evapotranspiration flux. The resulting isolated vegetation contribution to the flux is limited by vegetation canopy properties, which can then be compared with satellite vegetation indices. In order to make more progress in this area, collaborative links will be maintained with key BOREAS investigators in the Land Surface Climatology and Atmospheric Boundary Layer groups, and other selected BOREAS scientists working in the modeling of canopy photosynthesis.

This work will then be used to calculate fields of fluxes (Latent heat, Carbon dioxide, and heat) and surface state variables (photosynthetic capacity, canopy conductance) over the entire BOREAS sites based on satellite and, where appropriate, aircraft radiometric data. The effect of scale on this approach will be studied to determine the effects of using satellite data at various resolutions (30m to 1km) on the predicted flux fields.

Once we establish confidence in the SiB modeled fields, we will conduct simulation studies over the BOREAS mesoscale region, examining the effects of surface cover change on regional climatology and vice versa. Using this approach we can look at the effects of increased fire frequency on mesoscale albedo, net radiation, evapotranspiration and sensible heat transport.

P.I.(s):	Verseghy, D./Canadian Climate Centre
Title:	Improvement of Boreal Forest Modelling in the CCC GCM
Objectives and Approach:	It is proposed that field data collected during BOREAS be used to place on a firm theoretical footing the modeling of the boreal forest in CLASS (Canadian Land Surface Scheme), a second-generation land surface model which has been developed for the Canadian Climate Centre GCM by the investigator . Currently, because of a lack of data, canopy closure, albedo, etc.) corresponding to those of temperate coniferous forests. Bulk stomatal resistance, interception of rainfall and snowfall, and the evolution of the snowpack are treated in a very simple fashion, while assumptions about homogeneity or "patchiness" of the land surface are made to simplify the calculation of turbulent fluxes to the atmosphere. Data from BOREAS will enable the testing, refinement, and improvement of CLASS in these areas.

Deliverables

-- application of BOREAS results in an operational GCM framework

Needs from other groups

-- This project is an end user of the field data collected. Data obtained by the RSS groups will be used to improve the calculation of radiative properties of the boreal forest canopy. Information from the TF groups will enable the testing and refinement of the parameterizations of bulk stomatal resistance and surface bulk aerodynamic properties. Measurements made by the HYD groups will be used to validate the algorithms for canopy interception and snowpack growth and ablation. The activities of the TE groups will provide more detailed information on the physical characteristics of boreal vegetation types. Data collected by the BGC groups will be used at a future date, when CO<sub>2</sub> and trace gas fluxes are being incorporated in CLASS.

Input and output variables of CLASS:

Initially specified background grid cell characteristics: Vegetation:

--diurnally-averaged visible albedo

--diurnally-averaged near-IR albedo

--temporal variation of LAI

--standing mass

--rooting depth

Other:

--soil visible albedo, visible saturated albedo, near-IR dry albedo, near-IR saturated albedo, fractional sand and clay contents --fractional grid cell coverage of various land cover types --latitude, longitude, day of year --initial values of prognostic variables (see below) Micrometeorological forcing data:

--incoming visible, near-IR, direct shortwave, diffuse shortwave, and longwave radiation

--specific humidity, temperature, and wind speed of air above BL

--surface atmospheric pressure

--precipitation rate

Prognostic variables in CLASS:

--soil layer temperatures

--canopy layer temperature

--snow layer temperature

--liquid and frozen moisture content of soil layers --intercepted liquid water, snow, and ice stored on vegetation --snow mass on ground per unit area

--snow visible albedo, near-IR albedo, and density Areally averaged output variables:

--visible and near-IR albedo

--radiative surface temperature

--sensible and latent heat fluxes

--soil drainage

Title:	Boreal Forest Atmosphere Interactions: Exchanges of Energy, Water Vapor and Trace Gases
Objectives and Approach	The objectives are to measure the fluxes of sensible (H) and latent heat (E), momentum, CO <sub>2</sub> , and trace gases (CH <sub>4</sub> , CO, O <sub>3</sub> , and NO <sub>2</sub> above, the canopy of an old Aspen stand in Prince Albert Park during the year and to investigate the processes controlling these fluxes. They will be measured using the eddy correlation method with three-dimensional sonic anemometry and closed-path gas analysis (mainly tunable diode lasers (TDL) and open and closed path IRGSs). H and E will also be measured using the Bowen ratio/energy balance method. Below the overstory, H, E and CO <sub>2</sub> fluxes will be measured using the eddy correlation method. Concentration profiles of CO <sub>2</sub> ,H <sub>2</sub> O and the above trace gases will be measured in and above the stand. Soil manipulation experiments will be carried out to determine the response of microbial activity and gas production to changes in soil nitrate and carbohydrate levels. The flow of C and N through the litter/soil system will be measured in situ using <sup>13</sup> C and <sup>15</sup> N substrates. This project is complementary to TF-2 Deliverables to the project During Intensives Eddy Fluxes Above Stand u*, H, E, CO <sub>2</sub> , CH <sub>4</sub> , CO, O <sub>3</sub> & N <sub>2</sub> O (final decisions on extent of CO & N <sub>2</sub> O, TDL measurements will be made at time of experiments) Below Overstory u*, H, E, & CO <sub>2</sub> Concentration profiles in and above stand - wind speed, air temperature, H <sub>2</sub> O, CO <sub>2</sub> , CH <sub>4</sub> , O <sub>3</sub> , CO, N <sub>2</sub> O Energy balance components: Rn, incident and reflected shortwave radiation, incident longwave radiation, G, E, H and canopy energy storage Water balance components: precipitation, evapotranspiration, soil water storage and drainage Soil measurements: soil temperature, water content and potential, carbon and nitrogen pools, microbial activity Effective plant areaq index General climate (see TF-2)
	Between Intensives Eddy Fluxes Above Stand u*, H, E, CO <sub>2</sub> , CH <sub>4</sub> , and N2O Stand energy and water balances (as above) Soil temperature, water content and potential Effective plant area index General climate (see TF-2)

Title:	AES Flux Tower Measurements for BOREAS: Exchange or Energy, Water Vapor and Trace Gases Project
Objectives and Approach:	The objectives of this proposal are to quantify and examine the controlling factors for CO <sub>2</sub> , O <sub>3</sub> , CH <sub>4</sub> , N <sub>2</sub> O exchange at one Primary, the Old Aspen, Tower Site in PANP and to determine diurnal and seasonal surface energy fluxes at the same site. This study complements TF-1. The broader objectives of the combined proposals include determination of the annual cycle for carbon and nitrogen at the site, with trace gas measurements now also including CO, NO, NO <sub>2</sub> , NH <sub>3</sub> , and possibly terpenes. Four categories of measurements are proposed - (i) eddy correlation flux measurements of momentum, sensible heat, latent heat, CO <sub>2</sub> , O <sub>3</sub> , CH <sub>4</sub> and N <sub>2</sub> O above the canopy; (ii) within and above canopy profiles of temperature, CO <sub>2</sub> and O <sub>3</sub> ; (iii) half-hour means of wind speed, wind direction, incoming solar radiation, net radiation, PAR, temperature, relative humidity, wet precipitation, CO <sub>2</sub> , O <sub>3</sub> , CH <sub>4</sub> and N <sub>2</sub> O above the canopy, IR canopy temperature, and soil heat flux and temperature; and (iv) tethersonde profiles including O <sub>3</sub> . Four-week measurement periods would coincide with BOREAS intensives. Fluxes and half-hour means would also be measured between intensives in 1994.

Title:	Eddy Correlation Flux Measurements of $CO_2$ , $O_3$ , and NOy for BOREAS
Objectives and Approach:	Eddy-correlation flux measurements for CO <sub>2</sub> , and H <sub>2</sub> O will be made at the northern black spruce site from the late summer of 1993 through the fall of 1994. Our principle objective is to directly determine the net ecosystem exchange of CO <sub>2</sub> , and the surfaceenergy budget, over diurnal, seasonal and annual time scales, and to couple these observations with a comprehensive characterization of the physical environment (PAR, soil temperature, etc.). A low-power automated array will be installed to measure: eddy fluxes and forest column content of CO <sub>2</sub> , sensible heat, and water vapor; soil temperatures and moisture, and incident and intercepted PAR. The system will be operated continuously from installation in 9/93 through at least 10/94. Additionally, we will measure the flux of CO <sub>2</sub> from the soil during the summer of 1994 using an array of automated open chambers. Among onther things, these long-term measurements should allow us to assess the importance of winter respiration, and assimilation during transitional periods, tothe annual carbon balance of the boreal forest.

Title:	Exchange of Trace Gases, Water and Energy in Disturbed and Undisturbed Boreal Forests
Objectives	We will investigate carbon, water and energy fluxes in boreal forests. through an integrated approach involving flux estimates across the atmosphere-forest and soil-atmosphere boundaries. Eddy correlation measurements of CO <sub>2</sub> latent and sensible heat fluxes, and momentum will be made above a young Jack Pine stand in the Prince Albert area. Concentration profiles of CH <sub>4</sub> , <sup>12</sup> CO <sub>2</sub> , and <sup>13</sup> CO <sub>2</sub> will be determined within the canopy during one IFC. Soil-atmosphere flux studies will employ soil depth vs.gas concentration measurements, flux chambers and diffusion modelling to determine source and movement of CH <sub>4</sub> , <sup>12</sup> CO <sub>2</sub> , and <sup>13</sup> CO <sub>2</sub> in the airsoil-water continuum. The distribution and storage of carbon species in the soil profile will also be determined. Long term carbon accumulation will be evaluated by <sup>14</sup> C decay of soil carbon.
	Net incoming and PAR radiation leaf photosynthesis and certain soil parameters

Net, incoming and PAR radiation, leaf photosynthesis, and certain soil parameters (heat flux, thermal profile) will be measured at the site.

P.I.(s): CO-I(s):	Baldocchi, D/NOAA Crawford, T., Meyers, T., McMillen, R./NOAA
Title:	Experimental and Modeling Studies of Water Vapor, Sensible Heat, and CO <sub>2</sub> Exchange Over and Under a Boreal Forest
Objectives and Approach:	We propose to measure and model air-surface exchange rates of water vapor, sensible heat, and CO <sub>2</sub> over and under a boreal forest and to study the abiotic and biotic factors that control the fluxes of scalars in this landscape. This study is in conjunction with AFM-1. Scalar flux densities will be measured with tower-mounted eddy correlation flux measurement systems over an Old Jack Pine stand in the Prince Albert area. Tower-mounted flux measurement systems will be implemented above and below the canopy. This configuration will allow us to investigate the relative roles of vegetation and the forest floor on the net canopy exchange of mass and energy. We will also use the tower-mounted flux measurement system to study temporal patterns (diurnal and seasonal) of mass and energy exchange at a point in the landscape. Core Measurements include the mass and energy exchange studies just described, as well as measurements of measurements of meteorological variables.
	A hierarchy of single and multi-layer mass and energy (water vapor, heat, and CO <sub>2</sub> ) exchange models - bases on Eulerian and Lagrangian frameworks and on micrometeorology, radiative transfer, plant physiology, and biochemistry theory - will be developed and tested using the data obtained over a boreal forest. Comparing the hierarchy of models will enable us to rank the controlling variables and to develop a simpler surface exchange model that can be used by climate and ecosystem models. Our final goal is to drive the simple model with satellite-derived land-use data and meteorological information to evaluate the spatially-integrated surface fluxes.

CO.I.(s):	Schuepp, P.H./McGill, Nakane K., Hayashi, M./Japan, St-Amour, G./Agriculture Canada
Title:	Areal Estimates of Mass and Energy Exchange from a Boreal Forest Biome
Objectives and Approach:	The objective of this study is to develop techniques for studying the contribution of the boreal ecosystem to the greenhouse gas composition of the atmosphere and how this ecosystem responds to environmental conditions. Tower-based flux measurements of heat, momentum, CH <sub>4</sub> , CO <sub>2</sub> , NMHC, N <sub>2</sub> O, and H <sub>2</sub> O will be obtained during intensive field campaigns in 1994 over an Old Black Spruce stand in the Prince Albert area. These measurements will be compared with measurements from other research groups in order to verify their accuracy and combined with them to model the boreal forest ecosystem. Techniques will be developed to arrive at a spatial and temporal description of energy, water and carbon fluxes on a large area basis. The Japense section of this team lead by Prof. Nakane will measure CO <sub>2</sub> fluxes in the forest canopy by chamber technique. In addition, soil carbon cycle work will be done in the SSA-OBS and nearby clear-cuts.
Deliverables:	1. Half-hourl fluxes of momentum, CO <sub>2</sub> , sensible and latent heat.
	2. Fluxes of NMHC, $CH_4$ and $N_2O$ will also be provided for selected periods.
	3. Compositing of aircraft and tower-based measurements of these fluxes to obtain diurnal pattern of regional fluxes.

P.I.(s): CO-I(s):	Fitzjarrald, D.R./Atmospheric Sciences Research Center Moore, K.E./Statue Univ of New York, Albany
Title:	Surface Exchange Observations in the Canadian Boreal Forest Region
Objectives and Approach:	This study will focus on long-term measurements of radiation, heat, moisture, carbon dioxide and momentum budgets from the tower to be constructed at the Nelson House Old Jack Pine site. Turbulent fluxes are to be determined using the eddy correlation technique and radiative fluxes in the short, long, near infrared, and PAR wavelength bands will be acquired as well as soil moisture content. Collaborating with other groups the CO <sub>2</sub> gradient inside and just above the canopy will be acquired. We will also deploy a digital cloud camera to obtain a seasonal record of cloud fraction and, possibly, cloud type. Our plan addresses the following observational components of the BOREAS Science Plan: a) Radiation and cloud observations at a core site; b) Measurement of standard meteorological variables; (c) Seasonal-scale observations of evapotranspiration and sensible heat flux.

Title:	The CO <sub>2</sub> Exchanges of Boreal Black Spruce Forest
Objectives and Approach:	The objectives of this study are to measure and model the CO <sub>2</sub> exchanges of boreal black spruce forest and to determine whether the soils and vegetation are significant global sinks for atmospheric CO <sub>2</sub> . Stand CO <sub>2</sub> fluxes will be measured using eddy covariance and respiration components will be measured using chamber based techniques. The CO <sub>2</sub> concentration profile will also be measured to allow estimation of the atmospheric storage of CO <sub>2</sub> within the canopy. Further measurements of the photosynthetic components and of stand structure and radiation properties will be obtained by collaboration with other groups. These measurements will be used to construct carbon budgets and to test models (especially Maestro) that will be used to scale up the carbon budgets in space and time. Needs from Other Groups: Stand Structure Tree crown structure Leaf area density distribution Branch distribution Soil optical properties Leaf optical properties (visible and near infra-red) Leaf biochemistry especially nitrogen content Leaf physiological parameters - photosynthesis, respiration Leaf water potential, Leaf temperatures Air and leaf <sup>13</sup> C in the canopy Net radiation on the tramway Fish eye photographs

Title:	Surface Energy and Water Balances of Forest and Wetland Subsystems in the Boreal Forest: Surface-Atmosphere Links and Ecological Controls
Objectives and Approach:	We plan to carry out an intensive series of field experiments on the climatological implications of contrasting ecological controls on surface energy and water balances of forest and wetland subsystems of the northern Boreal Forest. The young-dry jack pine site and the fen site at the Thompson super-site have been selected for the work. For both surfaces, a complete suite of microclimatic (energy, radiation, and water balance data) and biophysical measurements will be taken. We propose to measure the flux of $CO_2$ at both sites.
	As part of the study concerning ecological controls on the hydrology and water balance of a wetland subsystem of the northern boreal forest, TF-10 will be conducting field work during the FFC-T at the fen site at Thompson. A spatially- distributed snowmelt model will be developed from measurements of net radiation, temperature, relative humidity and wind speed at both the fen tower and a nearby forested site. A snow survey consisting of a stratified random sample based on terrain types will be conducted and will include depth-stratified (snow pits) and depth integrated measurements of snow density and snow water equivalent. Other supporting measurements will include meltwater chemistry, depth to frost table, snow and soil emperature profiles as well as gap fraction measurements with a LAI- 2000 prior to green-up.
	We propose to measure the flux of $CO_2$ at both sites.
	Deliverables to the Project: Continuous for the 1994 experimental period
	Data to be collected at both the jack pine and fen sites, except where specified
	<ul> <li>Net radiation, global solar and reflected solar radiation, outgoing longwave radiation data</li> <li>Temperature, humidity and wind profile data</li> <li>Soil heat flux and soil temperature data (0.05, 0.1, 0.25, and 0.5, and 1.0 m depths)</li> <li>Leaf area index, age structure, spacing and diversity (periodic samples at both sites and over the basin)</li> <li>Water table elevation, groundwater flow, precipitation, stream discharge (fen site only)</li> </ul>
	Continuous for the IFCs
	All of the continuously collected data (see above) plus the following:
	<ul> <li>Leaf water vapor conductance and leaf water potential</li> <li>Leaf area index (spatial distribution)</li> <li>Sensible and latent heat fluxes from eddy correlation and reversing psychrometry</li> <li>Daily soil moisture</li> </ul>

Needs from Other Science Groups:

- GIS-based physiognomic data
- Various satellite products, including SPOT, TM, and TIMS data
- Soil properties data, including depth, type, mineral and organic matter fractional contents
- Fluxes of sensible and latent heat from other experimental sites and aircraft

Needs from the Project Staff

Jack pine site:

- Tower (approx. 12 m) and power (AC and 12V drops) installed
- Installation of access walkways and roadways to minimize site disturbance
- Instrument shed (3 x 3 m)
- Periodic visits to the sites to check on the integrity of the equipment when experiment operators will be absent

#### Fen site:

- Boardwalk (approx. 500-700 m) installed
- Instrument platform (2 x 2 m) installed
- Tower (approx. 5 m) and power (AC and 12V drops) installed
- Instrument shed (3 x 3 m)

General:

- Wet lab space (at least one 4-metre lab bench) with AC power
- Drying ovens and balances

P.I.(s): CO-I(s):	Verma, S.B./Univ of Nebraska-Lincoln Arkebauer, T.J Ullman, F.G./Univ of Nebraska-Lincoln, Parton, W.J., Schimel, D.S., Valentine, D.W./Colorado State University
Title:	Field Micrometeorological Measurements, Process-Level Studies and Modeling of Methane and Carbon Dioxide Fluxes in a Boreal Wetland Ecosystem
Objectives and Approach	We propose an integrated program of reasearch on field micrometeorological measurements, process studies and modeling of methane and carbon dioxide fluxes at a boreal wetland site (fen at SSA). The proposed research has the following four components.
	<ol> <li>Quantifications of surface exchange rates of methane and carbon dioxide at a boreal wetland site. The micrometeorological eddy correlation technique will be employed to obtain 'areally integrated' fluxes.</li> </ol>
	2. Evaluation of soil surface carbon dioxide flux and characterization of its response to controlling variables.
	3. Process studies will include field experimental manipulations to quantify the degree of substrate or pH limitations of methane production and oxidation. The

responses of leaf photosynthesis, plant respiration and stomatal conductance of dominant plant species to relevant controlling variables will be quantified experimentally.

4. Integration of the first three components to test and improve a model of decomposition and methane emission responsive to variability in moisture, temperature, and pH in northern wetland ecosystems.

Deliverables to the project:

The Anticipated data outputs are listed below:

1. Micrometeorological Flux Measurements Methane flux, atmospheric carbon dioxide flux, sensible heat flux, latent heat flux, soil heat flux, friction velocity, and supporting meteorological variables.

2. Experimental Manipulations of Factors Controlling Methane Emission Responses of  $CH_4$  production, oxidation and emission to treatments (*e.g.*, additions of N + P, substrate (EtOH), labile C, and acid or base titrants).

3. Leaf Photosynthesis Single leaf photosynthetic parameters for the dominant vascular plant species: Maximum rates (P  $_{max}$ ), quantum requirement, light and CO<sub>2</sub> compensation points, carboxylation efficiency, maximum rate of carboxylation of rubisco (V<sub>cmax</sub>), maximum rate of electron transport (J<sub>max</sub>), CO<sub>2</sub> compensation point, Leaf dark respiration rate (Rd). Maximum value of leaf stomatal conductance.

4. Modeling and Integration Rates of methane production, consumption and emission, rates of decomposition and fermentation, derivative of above rates with temperature, substrate availability, peat chemistry, pH and water table.

Core Measurement Needs:

a. Vegetation and soil classifications

b. Satellite imagery of the wetland research site for analysis of landscape variability

c. Above and below ground biomass--beginning and end of the growing season

d. Regular soil moisture measurements

Title:	Stores and Dynamics of Organic Matter in Boreal Ecosystems
Objectives and Approach:	The objective of the proposed research is to characterize the various soil-plant systems along a transect in one of the ecosystems selected for study at the southern BOREAS site. Particular emphasis will be on nutrient biochemistry, the stores and transfers of organic carbon and on soil properties and pedogenesis, and how the characteristics are related to measured methane fluxes. The transect in Prince Albert National Park will include the major plant communities and related soils that occur in that section of the boreal forest. Soil physical, chemical and biological measurements along the transect will be used to characterize the static environment, which will then be related to methane fluxes. Chamber techniques will be used to provide a measure of methane production/uptake. Chamber measurements coupled with flask sampling will be used to determine the seasonality of methane fluxes.

Title:	Autotrophic Respiration in Boreal Ecosystems
Objectives and Approach:	<ul> <li>Because respiration increases exponentially with temperature, and because warming is expected to be the greatest at high latitudes, autotrophic respiration strongly affects dry-matter production and carbon storage in boreal forests. The research will (1) estimate instantaneous and annual fluxes of CO<sub>2</sub> from all respiration for the footprint of tower flux measurements in three ecosystem types (Spruce, Jack Pine, Aspen) at the two BOREAS locations, (2) test the use of tissue content as a general estimator of CO<sub>2</sub> flux from respiration, (3) use paired genotypes, and (4) estimate an annual carbon budget for these sites (in cooperation with other scientists) to determine whether the ratio of respiration to photosynthesis among species and for different climates. Results from these investigations will better models for estimating CO<sub>2</sub>flux from autotrophic respiration, and clarify of autotrophic respiration in regulating productivity and carbon storage in ecosystems.</li> <li>Deliverables to the project: <ol> <li>Estimates of autotrophic respiration (instantaneous and annual budgets) ecosystem types (Black Spruce, Jack Pine, Aspen)</li> <li>Verification of a relationship between tissue N content and maintenance respiration</li> </ol> </li> <li>Needs from other science groups <ol> <li>Above- and below-ground biomass, NPP, and N and P content (by component for three ecosystem types (Black Spruce, Jack Pine, Aspen)</li> <li>Eddy-flux measurements of C flux for three ecosystem types (Black Spruce, Jack Pine, Aspen)</li> </ol> </li> </ul>
	Needs from project staff

1) Weather data for sites

2) Remote sensing of canopy temperatures and foliar N content, if scientifically possible

Title:	Measurement and Prediction of $CO_2$ and $H_2O$ Exchange from Boreal Forest Tree Species
Objectives and Approach:	We propose to measure steady state gas exchange and spectral reflectator responses to temperature, light, $CO_2$ and humidity in leaves of Aspen, Jack Pine, Black Spruce. Some of these measurements will be made within canopies of these species in the intensive field campaigns of 1994 and some will be made under more controlled laboratory conditions. Effects of leaf age, and conditions (temperature, light, nitrogen, water) will be measured. Specialized chambers and portable fields are being developed for use with broad leaf and conifer tissue. This data will be used to develop algorithms for predicting photosynthesis and transpiration from bidirect reflectance and to parameterize our mechanistic leaf and canopy models of $CO_2$ and exchange for the boreal forest.
Products:	We will report field and laboratory measurements of nitrogen concentration steady state photosynthesis, stomatal conductance and spectral reflectance (res. approx. 15 nm 1/2 band width between 400-1100 nm) under a variety of important atmospheric and soil conditions. This data will be useful for the development and parameterization of leaf based canopy and regional photosynthesis and evaporation models. We will refine our own models and assist in their implementation as compared to larger scale models.
	Needs from other science teams: (spatially and temporally matched with our study sites)
	<ol> <li>Minute to hourly meteorological conditions in the mixed layer, surface layer, with the canopy and/or at the leaf surface including temperature, water vapor, radiation, CO<sub>2</sub> and wind speeds levels (TF).</li> <li>Minute to hourly CO<sub>2</sub>, water vapor, sensible heat and radiative fluxes at the top canopy (TF).</li> <li>Spectral reflectance of vegetation at scales greater than leaf (RSS and TE).</li> <li>Minute to hourly values for soil respiration, bole respiration, litter moisture and temperature and rooting layer moisture and temperature (TE and HYD).</li> <li>Daily to weekly values of available solid nitrogen, leaf area index, litterfall and above ground herbivore and disease losses (TE).</li> <li>Seasonal above ground productivity (TE).</li> <li>Measurements of leaf gas exchange and spectral reflectance made by other (TE).</li> </ol>
	Support Requirements 1) 500KW @ 120V from flux tower power source.
	N 26

- 14 square feet of bench space with heat and power.
   0.05 cubic meters of freezer space.
   0.02 cubic meters of drying oven space.

- 5) Scaffolding to 12m at each of 3 sites.

Co. P.I.(s)	Norman, J.M./Univ. of Wisconsin
Title:	Measurement and Scaling of Carbon Budgets for Contrasting Boreal Forest Sites
Objectives and Approach:	The objective of this project is to examine the influence of vegetation, climate and their interaction on the major carbon fluxes for aspen, jack pine and black spruce forest ecosystems at the Southern Study Area and Northern Study Area.(Four, 15 x 15 m plots will be established at each site during the fall 1993 IFC. We will measure above- and below ground net primary production and use leaf respiration, autotrophic respiration and soil surface CO <sub>2</sub> flux data from other PI's to construct stand-level carbon budgets. Above-ground net primary production will be calculated annually for a 10-year period (1985-1994) from annual stemwood radial increment cores and site-specific allometric equations which will be developed in conjunction with M. Apps (TE-13). Below-ground net primary production will be estimated using sequential coring and carbon balance methods. Soil surface CO <sub>2</sub> flux will be measured weekly for the northern aspen stand during the IFC's using a LI-COR 6200 and soil respiration chamber. Soil surface CO <sub>2</sub> flux estimates obtained by this method will be compared to estimates obtained by PI's measuring soil surface CO <sub>2</sub> flux (using similar or different methods) at all mature forested sites at least once during 1994. We will develop a method to scale leaf-level photosynthesis measurements to the canopy level using measurements of canopy architecture and models of radiative transfer. The scaled canopy-level CO <sub>2</sub> fluxes will be compared to tower fluxes that are based on micrometeorological methods. We will develop and explore the utility of a new multi-band vegetation imager for indirectly determining forest canopy architecture in aspen and jack pine sites.

3) Soil surface CO<sub>2</sub> flux measurements for old aspen stand in NSA.

4) Archived plant tissue samples (stem wood, stem bark, branch, and foliage by age class and canopy position) for old aspen, jack pine and black spruce in SSA and NSA.

P.I.(s):	Hogg. E.H./Forestry Canada		
Co P.I.(s):	Ian Campbell, P.A. (Rick) Hurdel, Thierry Varem, Harjit Grewal/Forestry Canada		
Title:	Climate Change Effects on Net Primary Productivity of Productivity of Aspen and Jack Pine at the Southern Limit of the Boreal Forest		
Objectives and Approach	Regional climate-vegetation relationships indicate that the southern limit of the boreal forest is presently governed by moisture stress. this investigation aims to use a combination of field studies and modelling to predict how forest communities at the boreal forest's southern limit could respond to future changes in climate. The investigation includes short-term measurements of transpiration, photosynthesis, stem respiration and LAI, plus longer term studies of stand development, growth (tree ring analysis) and regional forest composition (palynology). this work will also form part of an ongoing Canadian study (BFTCS) of climate change effects on he functioning and carbon balance of the Canadian boreal forest.		
	Deliverables to the project An opportunity for an intensive, multidisciplinary study of ecophysiological/forest canopy processes in a jack pine stand near its extreme southern limit of distribution (Nisbet), and the potential for long-term monitoring of these processes at a site most likely to experience the greatest effects of climate change and increased soil dryness.		
	An opportunity for comparisons in structure and functioning of aspen in the southern boreal forest (PANP) with that in the more drought-prone aspen parkland (Batoche), where we have already initiated a similar study (Hogg and Hurdel).		
	LAI has already been measured at Batoche (Hogg) using a combination of litter fall traps and the Li-Cor LAI-200 and this could provide a non-destructive method of monitoring LAI at the PANP aspen site.		
	Measurements of leaf area index (LAI) and specific leaf are $(m^2/kg)$ destructive samples at several tower sites, along with some biomass and sapwood area measurements (Penner and Campbell).		
	Assistance with clone boundary definition for aspen (Hogg).		
	An opportunity for continuous, seasonal monitoring of transpiration (1993-94) in these most drought-prone sites by the heat pulse velocity method (Hogg and Hurdle).		
	Leaf level photosynthesis/transpiration measurements by Li-Cor 6200, coupled with scholander bomb measurements of leaf water potential (Hogg and Hurdle).		
	Measurements of soil temperature and soil moisture (fiberglass Colman blocks) at Nisbet and/or PANP aspen site (Hogg and Hurdle).		
	Measurements of tree stem respiration in aspen (PANP) and jack pine (Nisbet) during 1994. This will be replicated at the Nelson House supersite, resources permitting (Lavigne).		

-- Historical information and modelling of regional forest composition and growth processes which would provide the longer-term, larger-scale context for the 1-2 year, measurement time-frame of BOREAS (Campbell).

Needs from other science groups:

-- We would welcome the opportunity to collaborate with a team investigating decomposition, carbon allocation, nutrient cycling and below-ground processes.

-- Our research needs would best be met by working at a flux tower site in collaboration with a more experienced flux measurement team. A full flux tower at the Nisbet jack pine site is our first choice, but we would consider a more limited involvement with another team at the PANP aspen site, while using Nisbet as a terrestrial ecology/ecophysiology site only during BOREAS.

-- We anticipate that leaf level IRGA measurements will be made at PA aspen site and at Nisbet jack pine site, so that we can focus our IRGA measurements at Batoche (Hogg).

Needs from project staff and For Facilities/Measurements:

-- Penner requires some space to up lab balances and drying ovens. For leaf area measuring equipment, laboratory space at both supersites would be desirable.

-- Lavigne and Hogg wish to work at sites where standard meteorological measurements are being made, including air temperature at screen height, RH, PAR, soil temperature and soil moisture. These can be provided by Hogg at Batoche and Nisbet, but at the the other sites (PA aspen and NH sites), we are relying on these measurements being made by others.

-- An aerial overflight of the Batoche site would be very useful to us and to other investigators working on aspen within BOREAS.

-- We anticipate that leaf level IRGA measurements will be made at PA aspen site and at Nisbet jack pine site, so that we can focus our IRGA measurement at Batoche (Hogg).

Title:	Tree Bark Input in Tree-Atmosphere Interactions			
Objective and Approach:	The principal aim of this investigation is to evaluate the input of tree bark into tree-atmosphere interactions (i.e., the photosynthetic process).			
	(II) Investigation Summaries			
	Tree-atmosphere interaction is considered usually as "leaf" interaction with the atmosphere. But the input of tree bark is not negligible, especially during "leafless" periods (e.g., spring, fall, as well as after defoliation caused by insects or pollution), when the bark is the single source of hydrocarbons. The comparative analysis of biophysical properties of bark versus those of leaves must be done.			
	A. The studies should include:			
	<ol> <li>Comparative analysis of optical propertiesm (transmittance, reflectance, polarization) of bark and leaves.</li> <li>Comparative analysis of bark versus leaf pigment content.</li> <li>Estimation of LAI versus "BAI" ("bark area index").</li> <li>Comparative analysis of bark photosynthesis and evapotranspiration versus leaf photosynthesis/evapotranspiration.</li> <li>Comparative analysis of deciduous (Populus tremuloides) versus coniferous species.</li> </ol>			
	B. The choice of Populus tremuloides as the No. 1 objective is based on the following reasons:			
	<ol> <li>P. tremuloides is one of the dominant species in the boreal forest biome.</li> <li>P. tremuloides compete effectively with other species.</li> <li>P. tremuloides is one of the leaders in bark chlorophyll content.</li> </ol>			
	<ul> <li>C. The studies may be conducted at any one of three levels.</li> <li>1. "Bare Minimum Study Level" (BMSL). This would include: <ul> <li>(a) Bark optical properties.</li> <li>(b) Bark pigment content.</li> <li>(c) "Map" of optical properties and pigment contentfor the tree's stem and branches</li> </ul> </li> </ul>			
	<ul> <li>branches.</li> <li>Medium Study Levelwould include BMSL above, plus: <ul> <li>(a) Estimation of photosynthesis/evapotranspiration of bark.</li> <li>(b)"Map" of functional activity of tree's bark.</li> </ul> </li> <li>Optimal Study Levelwould include the two previous levels, plus: <ul> <li>(a) Seasonal aspect.</li> <li>(b) Age aspect.</li> <li>(c) Data sets should be obtained for all dominant tree species.</li> <li>(d) Polarimetric properties of leaves (needles) and bark for all dominant tree species.</li> </ul> </li> </ul>			

- (III) Field Measurements
- A. Sampling and design.
- Measurements should include: (a)Field measurements ("morphometry", LAI, "BAI", photosynthesis, evapotranspiration);
- (b)Lab-based measurements (bark/leaf optic and pigment content).
- 2. On test areas, 3 to 5 trees of each species should be chosen.
- Detailed tree inventory and "morphological" data should be obtained:
   (a) Height;
  - (b) Stem diameter at different heights;
  - (c) The length and diameter of branches of different age;

(d) LAI; (e) Total bark surface ("BAI"). 4-7. Pigment content, optical properties, evapotranspiration, rate of photosynthesis versus age of branch and its position in the crown.

- B. Parameters.
- 1. For measuring optical properties, chlorophyll content samples ("disks") should be taken from different heights on the stem and length of branch. Samples should be analyzed in the lab.
- C. Frequency.

1. Three data sets (spring-summer-fall) for the whole tree must be obtained. The highest frequency sampling rate (once per every 3 to 7 days) should be in the spring. It seems that in order to obtain reliable data, measurements should be made throughout an entire IFC.

Coordination should be done with TE-4, TE-9, TE-10, TE- 12, RSS-6, RSS-20 (to be specified). The work to be done at tower and auxiliary sites should be specified in May 1993, following site visits.

(IV) Supporting Measurements

Hourly surface weather data will be necessary. Aircraft/satellite data for the beginning-middle-end of growing season.

(V) Infrastructure Needs

Power: 120V AC; 12V DC. Lab space: 2 square meters of bench space.

## (VI) Next Steps

- A. 1993 IFC priorities:
- 1. Coordination with colleagues.
- 2. Checking the equipment and methods.
- Collection of "bare minimum" data set which is necessary and sufficient for (a) Preparing for 1994 IFC's; (b) solving the problem at "zero approximation". It includes:

(i) Inventory data and "morphological" assessment of a tree;

(ii) Optical properties of bark; (iii) Bark chlorophyll content; (iv) Estimations (first approximation) of photosynthesis and evapotranspiration.

B. 1994 IFC's:

Evaluation of dynamic aspects of tree bark-atmosphere interactions (during the growing season):1. During the spring: activity of bark versus leaves in"transition period" (i.e., from the opening buds of maturation of leaves).2. The middle of growing season. 3. The end of growing season.

The timing of the 1994 IFC's/FFC's will be decided after May 1993 site visits and Winnipeg workshop discussions.

P.I.(s):	Margolis, H.A., Edwards, G., Thomson, K.P.B., Viau, A. (Université Laval)
Title	Relationship Between Measures of Absorbed and Reflected Radiation and the Photosynthetic Capacity of Boreal Forest Canopies and Understories
Objectives and Approach:	This project will examine the relationship between net photosynthetic (net Ps) capacity, N concentration and percent photosynthetically active radiation (%PAR) of three major boreal forest cover types (jack pine, black spruce and aspen) as well as their link to remotely-sensed and land-based measures of reflected and absorbed radiation. We will attempt to establish general relationships which can be used to predict the vertical distribution of the net Ps capacity for these cover types, including their understories, when neither water nor temperature is greatly limiting. We will also determine how these relationships will vary over the growing season and among six different stand conditions at the Northern Study Area (NSA). Furthermore, the photosynthetic response surface of foliage from the three main cover types with respect to light, temperature, vapor pressure deficit and internal CO <sub>2</sub> will be determined during each IFC using a laboratory-based photosynthetic system with cut branches. The effects of in situ frost exposures on the photosynthetic characteristics of the three main cover types as well as their patterns of recovery will be determined with geometry measurements taken within the the canopy will be supplemented with geometry measurements of the different canopy constituents and the spatial variability of these measurements within the stand will be examined. Additionally, the BDRF of soil and understory components, the spatial variability of the spectral signatures of soil and understory components, and the spectral distribution of hemispherical downwelling radiation will be characterized in order to drive and validate a forest canopy reflectance model (TRELITE). This model will be used to estimate PAR levels within the various forest canopies and these estimates will then be used as input to the photosynthetic model. Depending on the availability of additional resources, canopy biochemistry (lignin, cellulose, starch, sugars, chlorophyll and terpenes) will be followed over the growing season for si

Deliverables to:

	Photosynthetic response surface (i.e., response to light, temperature, vapor pressure deficit and $CO_2$ ), nitrogen concentrations and specific leaf area of foliage from a vertical profile of the three main cover types including understory and mosses.
	Estimation of canopy photosynthetic capacity for the growing season.
	Punctual measurements of PAR levels at different vertical levels.
	BDRF and spatial variability of reflectance of soil and understory components spectroradiometer.
	Occasional measurements of leaf water potential.
	Testing and validation of TRELITE.
	Possibly canopy biochemistry (depending on other resources becoming available).
	eds from other Science Groups:
	Maintenance respiration (Ryan)
	Annual soil respiration (Ryan)
	Above- and below-ground carbon accumulation (Gower)
Nee	eds from Project Staff:
	Helicopter-based measurement of canopy reflectance of three to four Nelson House flux tower sites and three to four auxiliary sites using Spectron SE-590.
	CASI measurements of canopy reflectance for same sites as in 1.
	ASAS and Landsat simulator measurements of canopy reflectance from NASA C-130 for same sites as in 1.
	AVIRIS measurements of canopy reflectance from ER-2 for same sites as in 1.
	Daily climatic data in the vicinity of Nelson House stands for average daily, maximum and minimum air temperatures, vapor pressure deficits, relative humidity, solar radiation (PAR), soil moisture.

Title:	CO <sub>2</sub> and Water Fluxes in the Boreal Forest overstory: Relationship to fAPAR and Vegetation Indices for Needles/Leaves		
Objectives and Approach:	In this study we will correlate physiological processes at the leaf/needle level with optical measurements amenable to remote sensing. Specifically, <i>in situ</i> measurements for gas exchange flux rates for CO <sub>2</sub> and water, plant stress as indicated by chlorophyll-a fluorescence, and other supporting measurements will be acquired for dominant species of the boreal forest overstory at the BOREAS Southern sites (mature aspen, mature jack pine, young jack pine, black spruce, and mixed aspen/white spruce). In the laboratory, further measurements of photosynthetic capacity will be made in conjunction with continuous visible/near-infrared spectral optical properties and pigment analyses. Nitrogen will be determined from dry foliar material. This data set will be utilized to estimate the vertical gradients of carbon assimilation, nitrogen use efficiency, and photosynthetic efficiency for different species as a function of phenology and environmental conditions, especially available water, nitrogen, and PAR. These data will be used to examine the relationships between the physiological parameters, especially photosynthesis and conductance rates, and the optical parameters (fAPAR and spectral vegetation indices, or SVIs). They		

will also be used to parameterize the canopy level radiative transfer and physiological models utilized in landscape in landscape analyses by other investigators.

Title:	Seasonal Variations of Net Photosynthesis and Transpiration at the Tree Level		
Objectives and Approach:	The objective is to monitor the net assimilation and transpiration rate of trees throughout the 1994 growing season, at the Prince Albert Old Jack Pine site (and short sapflow measurements in P.A. mixed-stand). For this we propose the following steps using several original methods:		
	<ol> <li>Installation of sapflow probes in the trunk of 6 representative trees in PAOJP at the end of FFC94-T, monitoring of sapflow from May to September 1994 (Prince Albert Mixed Site will be equipped with sapflow probes during the IFC92-2 campaign only) The probes are laboratory made, constant heated needles.</li> <li>Measurements during IFC94-2 of CO<sub>2</sub> and H<sub>2</sub>O exchanges of 2 representative branches (PAOJP). Estimation of the water use efficiency (WUE: CO<sub>2</sub> assimilation/transpiration). The gas-exchange is measured in home-made cuvettes operating in a closed system for 5 minutes every half-hour.</li> <li>Modelling of photosynthesis, transpiration and WUE of the branch. WUE varies with VPD and may vary through the season (needle age). This will be chcked by measuring the delta <sup>13</sup>C of growing shoot samples collected monthly (collaboration with TF-5).</li> <li>Use of 1., 2. and 3. to predict trees transpiration and carbon uptake during whole season.</li> </ol>		
	Sap flow measurements will be compared with eddy correlation measurements of $H_2O$ and $CO_2$ fluxes above the forest. Simple models of forest productivity will be tested using data form the site: a "top-down" model of the Monteith type and a mechanistic "bottom-up" model, both developed in the laboratory.		
	Forest inventories, geostatistic models and remote sensing data will be used to extend the plot measurement to the region.		
	<ol> <li>Diameter at breast height inventories will be used to extrapolate single trees transpiration measurements to the stand.</li> <li>Extensive LAI measurements (from other teams will be used for geostatic purposes.</li> <li>Continous and discreete algorithms of radiative transfer will be tested to derive surface parameters (PAR interception and LAI) from remote sensing data, and from cover maps. to extrapolate to the whole BOREAS region.</li> <li>Tentatively, we'll try to measure CO<sub>2</sub> /H<sub>2</sub>O exchange of the lichen layer at PAOJP</li> </ol>		
	using plastic enclosures, including a T/RH sensor, connected to a portable IRGA (collab. with TE-5).		
	Deliverables to the Project:		

Preliminary 1993 campaign have shown the feasibility of measurmeents during a week (days 239-244). All measurements will be made during the 1994 gowing season. All the resulting data will be processed and quality checked during the winter season of 1994-95, and delivered to BORIS at the beginning of 1995. Results of model and spatial extension will be published by the end of 1995. The following raw data to be delivered to BORIS:

Parameter Measured	dt	Period of Measurement
sapflow on 6 trees (PAOJP)	30'	5/5-9/10/94
sapflow on 6 trees (PAMS)	30'	IFC94-2 (ext. to 8/15/94)
$CO_2$ and $H_2O$ exchange on 2	30'	IFC94-2 (ext. to 8/15/94)
branches		
d <sup>13</sup> C of growing shoots	month	5/94-9/94

These data will be used to calculate the following parameters:

Parameter Calculated	dt	Period of Measurement
transpiration of trees	30'	94 Growing season
net photosynthesis of trees	30'	94 Growing season

Needs from other science groups:

- Other items of the carbon budget in PAOJP; above-and below-ground biomass increments, autotrophic respiration, soil respiration, CO<sub>2</sub> and H<sub>2</sub>O fluxes above and under the canopy.

- Data on sapflow, gas exchange (any level), and stable isotopes on all sites.

- Data on water vapor and aerosol content in the atmosphere, for remote sensing correction.

- In-situ measurements of reflectances, albedo, incident global ratiation and intercepted PAR for validation purposes of remote sensing algorithms.

- Data on canopy geometry (trees height, branch angles and length), radiative properties of canopy and substrate (soil, snow, lichens).

- Airborne fluxes of CO<sub>2</sub> and H<sub>2</sub>O and airborne radiometric measurements.

Needs from Project Staff:

- Canopy access tower for housing the branch bags

- Manpower to collect samples of shoots at diffeent levels in the canopy (PAOJP) every month during the growing season.

## Needs in ancillary data:

- Specific biometric relationships and forests inventories (diameters at breast height to retrieve: sapwood area, leaf area of branches, LAI, biomass per units.

- Climatological data (all available data).
- Aerial photographs of all Prince Albert sites.

Equipment we plan to bring:

- FFC94-T: sapflow probes, a Campbell CR21 data logger and a power supply

- IFC94-2: sapflow probes, two Campbell CR10 data loggers, two IRGAs (CID 301-PS and ADC LCA2 or PP systems EGMI), a pressure chamber (PMS).

P.I.(s): CO-I(s):	Walter-Shea, E.A./Univ of Nebraska Arkebauer, T.J./Univ of Nebraska
Title:	Radiation and Gas Exchange of Canopy Elements in a Boreal Forest
Objectives and Approach:	Coordinated research program emphasizing measurements of radiation and gas exchange characteristic of canopy elements and resulting interactions of radiation and gas exchange within canopy environments in a boreal forest ecosystem with the following components:
	1. Characterization of foliage element and substrate optical properties during periods. Leaf, needle, twig, substrate and shoot optical properties will be made

periods. Leaf, needle, twig, substrate and shoot optical properties will be made and conifer shoot geometry will be characterized. Models will be used to aid understanding of key variables influencing canopy element optical properties.

2. Characterization of gas exchange of canopy elements during critical periods. Responses of  $CO_2$  exchange and stomatal conductance to environmental factors and diurnal courses of photosynthesis, respiration and stomatal conductance of canopy elements will be determined. Models will be used to describe the influence of relevant controlling variables on  $CO_2$  and water vapor fluxes.

3. Integration of foliage optical properties and gas exchange characteristics. Many will be used to couple radiation and gas exchange of canopy elements under and total radiation conditions.

Deliverables to the Project:

Туре	Estimated volume of Data Sampling	Frequency	Submission Medium
Leaf, needle, twig, and substrate optical properties	4 samples x 3 ages x 3 trees x 3 species x 3 weeks x 4 IFC x 252 wave bands	5-6 samples per hour during suitable conditions	Floppy disk and/or network
Substrate optical pro- perties (tripod mounted radiometer)	4 samples x 3 substrates x 3 weeks x 4 IFC x 252 wave bands	periodic, suitable and canopy conditions	Floppy disk and/or network
Shoot bidirectional reflectance (and transmittance)	2 samples x 3 ages x 3 species x (4 IFC + 2 FFC) x 252 wave bands	2-4 samples per day on days when measure- menets are made	Floppy disk and/or network
Gas exchange	5 response curves x 3 ages x 3 canopy heights x 3 species	each IFC	Floppy disk and/or network

#### **Core Measurements**

#### **Products Derived from Core Measurements**

Туре	Estimated Volume	Frequency	Submission Medium
Light use efficiency	Same as gas exchange	For each sample from which diurnal gas exchange was measured	Floppy disk and/or network
Modeled spectral bidirectional reflec- tance and transmit- tance of shoots	2 samples x 3 ages x 3 species x (4 IFC + 2 FFC) x 252 wavebands	estimated for each illumination-shoot geometry measured	Floppy disk and/or network
Estimated spectral directional and bi- hemispherical reflec- tance, transmittance and absorbtion of shoots	3 ages x 3 species x (4 IFC + 2 FFC) x 252 wavebands	approximated for each age of each species	Floppy disk and/or network
Shoot and leaf directional and bi- hemispherical frac- tion of absorbed PAR	3 ages x 3 species x (4 IFC + 2 FFC) x 252 wavebands	approximated for each sample	Floppy disk and/or network

Derived physiological 3 ages x 3 canopy each IFC parameters associated heights x 3 species with photosynthesis, stomatal conductance and dark respiration.

Needs from Other Science Groups:

Coordination with site selection of old black spruce at Prince Albert:

- 1. Don Deering (RRS-1) PARABOLA measurement
- 2. Eddy flux measurements (tower)
- 3. Remote sensing "super site" N. Goel modeling study at which detail measurements of canopy structure (LAI, shoot angles, branch area index, tree density and height are made.

It is necessary to locate all these near the sample place (i.e., in the same homestand so the modeling work (canopy bidirectional reflectance, canopy  $CO_2$ ? would complement the measurement work (shoot bidirectional reflectance and exchange, canopy bidirectional reflectance and eddy flux  $CO_2$  exchange).

- Calibration of spectroradiometer, radiometers (and wavelength characterization) and reference panel.

\_ Measurements of shoot axis inclination and orientation.

- Chlorophyll, lignin and nitrogen contents of needs from trees in our site preferable coordinated with our measurements.

- Leaf and shoot extension data.
- Meteorological data collected on site.

Needs from Project Staff:

- Scaffolding to provide platform from which to measure canopy component optical properties and shoot photosynthesis.

- Electrical power to power light sources and recharge batteries at the site. Computers and spectroradiometers may need external power at times of extended research hours. - On-site tent area for optical pressure chamber and shoot geometry measurements.

- Room for shoot bidirectional reflectance measurements near lodging for measurements. The room must be the following minimum requirements (1) dimensions of 13 ft. wide x 13 ft. long x 10 ft. high; (2) ability darken room, electric power for powering light source and computer.

- Collection of branch samples to be packed and shaped to the University of Nebraska, Lincoln for shoot bidirectional reflectance, needle optical property, shoot geometry measurements at various times during 1993 and 1994, par for FFCs.

- Delivery of nitrogen gas for leaf and shoot water potentials and CO<sub>2</sub> standard gases for analyzer calibration for leaf and shoot gas exchange.

- Cool-room storage and accessibility to ice for storing and shipping samples.
- Customs clearance of all vegetation samples from Canada to United States.
- Lab space for sampling drying, access to drying ovens.

**Destructive Sampling:** 

Four small branches with the three age classes represented will be harvested from each tree each day. Three trees will be selected from which samples will be made for optical property measurements.

For each assimilation, stomatal conductance response curve, determined as above, approximately 3 small (<20 cm) shoots will be removed from the can water potential measurements. In addition, the measured shoot (<20 cm) will be removed. Approximately 100 of these shoots will be removed, spread over the canopy height, per IFC.

P.I.(s):	Apps, M.J/Forestry Canada
Co: P.I.'s:	Price, D.T./Forestry Canada Kurz, W.A./ESSA Environmental and Social Systems Analysts Ltd.
Title:	Annual carbon budget and climate induced changes in boreal forest ecosystems at the landscape level.
Objectives: and Approach:	The objective of this work is to scale up existing (and emerging) understanding of ecological and climatic controls on annual carbon cycling in boreal forest ecosystems to landscape level. These will be used to provide process-driven linkages to an existing national-scale carbon budget model of the Canadian forest sector (CBM-CFS), to provide prognostic assessments of future carbon budget contributions by Ganadian boreal forests under alternative scenarios of climate change and resource management (Apps and Kurz, 1991). Scaling of the representation of process controls on net ecosystem productivity will be performed both spatially and temporally to match the CBM-CFS, which presently operates with a borad ecological / climatological spatial resolution and on an annual time step. A meta-model (response surface) approach is being developed to link process-orientated sub-models of forest ecosystem productivity to biomass), esplicitly accounting for the influence of disturbances, will be simulated to provide estimates of annual carbon fluxes with the atmosphere (and within the terrestrial carbon pools) along a transect through the boreal forest. This transect will extend beyond the Nelson House study area to the aspen parkland (Batoche, saskatchewan). Existing models of stand-level carbon budgets will be tested against detailed observations of biomass, soil and litter carbon pools at representative pure stands of study areas, and at sites in the mid-transect. Subject to funding confirmation, biometry and allometry measurement will be made in these stands in conjunction with other BOREAS investigators (TE-6, TE-7) to provide the observational database for these validations. The sites will be selected to reinforce other TE measurements and tower flux measurements and will be part of the Forestry Canada contribution to the core measurement program. Anticipated BOREAS empirical data and other BOREAS modeling results will be used to perform limited validation checks on the CBM-FS approach. Data contribution to the CBM-CF
	The research seeks to estimate (1) the sites of ecosystem carbon, (2) the annual of carbon between ecosystem compartments and with the atmosphere, and ecological and climatic controls on these pools and fluxes. This work will be ?? within the context of Forestry Canada's Boreal Forest Transect Case Study (BFTCS) extends from the aspen parkland (Batoche National Park, south of Prince Albert ?? the BOREAS sites in the boreal forest and into the sub artic woodland (Cillam
	BOREAS sites in the boreal forest and into the sub-artic woodland (Gillam, northeast of Thompson). The BFTCS is a key experimental project of Forestry climate change research program and involves a number of parallel Forestry Ca?? collaborative investigations. Some of these are explicitly reflected in the proposal submitted by Dr. E.H. Hogg while other contribute less directly to BOF more to the

longer-term, broader scale NBIOME activities. The overall goal of the ?? to develop predictive understanding of the ecological and climatic processes that boreal forest structure and function at the biome level in order to assess the ?? of these forests to potential changes in climate. The modeling activity outlined addresses the carbon cycle feedback aspects of this vulnerability.

The focus of the carbon budget assessment work will be on the net carbon between forest biomass, forest floors and soils at the landscape level and on a ?? basis. Net annual atmospheric fluxes are based on mass conservation estimated changes in these pools and includes direct release by disturbances such as fire. The Budget Model of the Canadian Forest Sector (CBM-CFS, Apps and Kurz, 1991: Kurz 1991) will be used as the modeling framework. This model has been used to ??? first national scale estimates of Canada's forests' contribution to the global carbon (Kurz et al., 1992), finding it to be a weak, but vulnerable sink for atmospheric the reference year 1986.

The CBM-CFS model estimates net ecosystem production at a pseudo-stand level by simulating biomass-ver-age curves for biomass carbon accumulation, standage dependent litterfall transfers to the forest floor and transfers between the forest and soil organic matter using a simple 3 compartment model. Forest floor decom?? rates are ecosystem (site) specific and are related to the stage of stand development variable exposure factor to capture the short-term (<100 year) changes in carbon following disturbances.

Structure has been designed to facilitate process simulation. The phase 1 model is strongly data-drive by relationship derived from Canada's national forest ciomass inventory, the Oak Ridge National Laboratory (ORNL) soil and data base, and annual forest disturbance statistics for wildfire, insect damage and harvest records maintained by Forestry Canada and Statistics Canada. These relationships are clearly not appropriate for prognostic analysis but are the best for obtaining results for a benchmark, reference year.

Disturbances, particularly fire in the mid-continent boreal forest, play an ecological role in maintaining both the structure (e.g., forest cover types and distributions) and the function (e.g., growth and decomposition processes) of the forest. The CBM-CFS explicitly simulate three facets of disturbance influences for forest carbon flows: (1) direct release of carbon to the atmosphere, (2) transfers between biomass and the forest floor, (3) determine the age-class-structure subsequent biomass dynamics) of the forested landscape. These last two factors in many assessments, are expected to play increasingly important roles in a climate where disturbance rates are expected to increase (Flannigan and Van 1991) and ecosystem successional processes will be affected (e.g., Overpeck et al.) In the CBM-CFS estimate of carbon flows for 1986, the wildfire effected transfers to the forest floor which exceeded the carbon release to the atmosphere at least a factor of two (Apps and Kurz, 1991).

The CBM-CFS model will be scaled down from a national scale to the regional scale appropriate to the BOREAS sites and the NBFTCS, making use of higher spatial resolution data in the forest biomass inventory, the regionalized CBM-CFS will be used to in?? the estimates of carbon stored in biomass. Below-ground estimates will initially be derived using (limited) regionally specific allometric relationships (and will be subsequently improved suing results from other BOREAS studies and in follow-up ?? research). Parameterization of forest floor and soil dynamics in the model will be direct measurements of forest floor decomposition rates across the boreal transect during and subsequent to BOREAS (Trofymow et al.). Soil carbon data from the ORN database, will be supplemented by data from a Canada-specific forest soil carbon base currently being compiled as part of the CBM-CFS project.

Comparisons of CBM-CFS estimates of annual carbon fluxes at the BOREAS sites empirical resulls and estimates from her, more process-oriented mechanistic

(?? empirical models expected to be proposed for BOREAS (e.g., bonan, Running, Hunt) used to provide limited cross-validation tests. Because the CBM-CFS ioerates at a kevek if aggregation than most mechanistic ecosystem models, this comparison is anticipated to require scaling up of their results to an annual value and to the sp?? scale of the BOREAS supersites.

As stated previously, the objective of the CBM-CFS is to develop a prognostic mo?? assessing the vulnerability of future forest carbon budgets. Process representation CB-CFS is relative simple and climatic controls are currently exercised by pr?? modifiers of site growth rate, carrying capacity, decomposition rates, and change disturbance regimes. Although the BOREAS project is restricted to a single growth season time-slice, it is anticipated that significant advances will be made in the ?? modelling of climatic controls on ecosystem dynamics. A metmodel structure is developed (Price and Apps, 1992) to link such process models to the CBM-CFS fra??. This meta-model structure will scale up the intra-annual processes and will empl?? nested set of process-based models of differing resolution to provide analyzed surfaces for biomass and forest floor dynamics under different climatic condition response surfaces will be used to capture predicted changes in ecosystem function productivity. In addition, by incorporating sucession-level models in these response surfaces, they should be able to simulate the potential for flips in ecosystem sta?? trajectories following disturbances, and this is an area of priority research in NBI.

The meta-model development will be initiated during BOREAS by focusing on bior?? dynamics (which is currently the best-understood area of ecosystem function) are continued during the NBIOME project. Initially, FORSKA2 (a boreal forestspecific model variant developed by Prentice, Leemans and co-workers) will be used to si?? forest dynamics across the boreal transect landscape and to develop biomassover parameterizations for key forest types (hardwood, softwood and mixed woods) under different climatic conditions. In future investigations, other mechanistic models used, with particular attention being given to those incorporating ecophysiological controls which are expected to emerge during the BOREAS project. These models ?? be performed on a Canadian parallel-process supercomputer (MYRIAS) and FORSK/?? has already been modified to make use of this technology. The parallel computing environment is currently being used to explore the meso-scale dynamics of forest disturbances (fires and insects) by prescribing spatially-linked interactions between neighboring forest patches to simulate contagion.

#### Resources

Forest Canada, Northwest Region has a strong base of computer hardware/software support staff. In addition to VAX computers, a network of dedicated based Pcs and SUN workstations, the climate change modelling group has uni?? (and free) use of the MYRIAS parallel-process supercomputer at the University Alberta Physics Department.

Forestry expertise at the Northern Forest Centre is particularly strong in ecology modelling and the centre has been appointed the lead centre for forestry Canada's Climate Change program. Dr. D. Price is a visiting scientist working with Dr. Apps with proven record in canopy ecophysiology modelling, complements the group's expertise.

Ongoing contract (M. Apps, Scientific Authority) work with the CBM-CFS model is conducted under external funding (Federal Panel on Energy R&D) and these funds were used to support Dr. Kurz' involvement as a consultant to model validation activities.

Scientific staff in other Forestry Canada centres (in Petawawa National Forestry Institute, and Newfoundland) have been identified in Dr. E. H. Hogg's BOREAS proposed 7). These and other participants in the Boreal Forest Transect Case Study Experiments are expected to contribute to the collection of data across the transect (of \_\_\_\_\_\_ Pacific Forest Centre will \_\_\_\_\_\_ rates although all these data will be available during the BOREAS campaign and are not reflected in the budget.

#### Management

Dr. Apps is the designated team leader for forestry Canada's Climate Change rese?? program. He also leads the development of the CBM-CFS model and is Scientific ?? for contracted model applications at ESSA Ltd. He will be responsible for coordinating model development, collection of transect data required by the model, and comparison data for validation.

P.I.(s):	Bonan, G. B./NCAR	
Title:	Estimating Regional Biosphere-Atmosphere Exchange of Carbon Dioxide and Water in Boreal Forests with Ecosystem Models	
Objectives and Approach:	Models provide a means to extrapolate processes to large spatial and long temporal scales. I will conduct simulation analyses with coupled ecosystem and land surface process model to: (1) identify key physiological processes and ecological variables needed for a general predictive model of biosphere $CO_2$ and water fluxes; (2) quantify errors produced by parameter uncertainty; (3) derive seasonal and annual $CO_2$ and water budgets for several BOREAS tower sites and the two regional sites.	
	Global extrapolation will proceed by coupling the land surface process model to the NCAR Community Climate Model. Regional estimates of CO <sub>2</sub> , water, and energy exchange obtained from the off-line modeling will be used to test the representation of sub-grid scale land surface heterogeneity for the land surface process model.	
	The major deliverables to BOREAS are seasonal and annual $CO_2$ and water budgets for individual tower sites and the two regional sites. This will require from other groups ground truth data for particular forest types to initialize and validate the models. It will also require from the BOREAS Project Staff meteorological data to force the models (30 minute resolution, collected for one full year); and maps of ecosystem and soil cover for the southern and northern sites.	

P.I.(s):	Bukata, R.P./National Water Research Institute
Title:	Utilizing Remotely Sensed Data to Model Limnological Carbon Budgets and Primary Production in Boreal Ecosystems
Objectives and Approach:	We propose to use remotely-sensed data to determine the co-existing concentrations of aquatic chlorophyll, dissolved organic matter, and suspended inorganic matter. The chlorophyll estimates will be used to model primary production through transfer coefficients. The dissolved organic matter estimates and the primary productivity will be used to model the carbon budgets of the lakes in the BOREAS test area.
	Remotely-sensed data will be acquired by the Airborne Ocean Color Imager (AOCI) from NASA flying on the ER-2 at 20 km with 50 meters resolution and by the Compact Airborne Spectrographic Imager (CASI) from York University. The CASI will fly at lower altitudes to provide higher spatial as well as higher spectral resolution. The AOCI data will be atmospherically corrected using methodology recently developed by NASA investigators. Extension of the atmospheric correction methodology to the CASI data will be performed.
	The inherent optical properties of aquatic chlorophyll, dissolved organic matter, and suspended inorganic matter will be determined by direct sampling and in situ mid-lake measurements using surface and underwater spectroradiometers. When used in conjunction with the atmospherically corrected AOCI and CASI data, these inherent optical properties will enable the determination of the concentrations of

chlorophyll and dissolved organic matter necessary for modelling primary productivity and the carbon budget.

Title:	Land Cover and Primary Productivity in the Boreal Forest
Objectives and Approach:	The study is aimed at addressing the use of satellite data in ecological monitoring with emphasis on two parameters, land cover and ecosystem productivity. For land cover, the objective of the research is to determine improvements in land cover type identification with data from future sensors (simulated MODIS, Radarsat SAR), compared to research presently underway which emphasizes AVHRR. For productivity, the principal objective is to assess the feasibility of estimating forest primary productivity and net primary productivity using models that can be realistically applied over large areas yet have high spatial resolution. To be practical, the models should require a minimum of data that (i) can be obtained from satellites or (ii) can be cost-effectively obtained over large areas. Such models have been formulated and tested in recent years, and will be included among those models studied in other BOREAS investigations. The intention in this study is to focus on the contribution of remote sensing data at the landscape and regional levels, and to collaborate with modelers in validating remote sensing inputs and model performance. Specific tasks to be carried out include: improvement in land cover determination and information on seasonal dynamics from simulated MODIS and RADARSAT SAR data; derivation of site and landscape ecosystem parameters (bidirectional surface reflectance, vegetation indices, vegetation density) from optical data in relation to the sensor spatial resolution ( $10^2 \text{ m to } > 10^3 \text{ m}$ ); feasibility of direct APAR estimation from AVHRR and similar data; the relationship of instantaneous gas (CO <sub>2</sub> , H <sub>2</sub> O) exchange to satellite-derived reflectance and emission quantities; and derivation of the above and related quantities for testing ecosystem productivity models at the regional level.

P.I.(s): CO.I.(s):	Goward, S.N./Univ of Maryland Prince, S.D., Dubayah, R., Townshend, J./Univ. of Maryland, Tucker, C.J./NASA/GSFC
Title:	Biospheric Dynamics in the Boreal Forest
Objectives and Approach:	A study of primary production in the boreal forest ecotone using regional scale models driven by coarse-resolution satellite data. The primary scale of interest is the BOREAS inter-site transect and the entire N. American Boreal Forest biome. Net primary production (NPP) will be modelled using production efficiency models (PEM), parameterized using the detailed field site measurements planned at the Intensive Study site scale (400km2). A multi-scale analysis will be used to address the problem of scaling of information from the ISS to the regional scales.

P.I.(s):	Hall, F.G., Sellers, P.J./NASA/GSFC, Nelson, A.K./USRA
Title:	Regional-Scale Carbon Flux from Modeling and Remote Sensing
Objectives and Approach:	To use long-term satellite remote sensing to characterize the successional and disturbance dynamics at a regional scale and to associate, via the use of carbon flux models, these dynamics with carbon flux.
	Landsat MSS and TM, SPOT and AVHRR data will be acquired for the BOREAS study area, including both supersites and the intervening transect for the period of record of each satellite (Landsat back to 1972). Key successional stages will be identified using pattern recognition and machine processing. The rates of changes between successional stages will then be quantified using change analyses. These results will be combined with ecophysiological models that relate carbon flux the successional state and climate history to estimate regional carbon flux.

P.I.(s): CO-I(s):	Harriss, R.C./Univ of New Hampshire Aber, J., Frolking S.E./Univ of New Hampshire
Title:	Modeling Climate-Biosphere Interactions in the Boreal Forest
Objectives and Approach:	We propose a research program which integrates and advances two separate models we have recently developed for understanding carbon and nitrogen cycling in soil and vegetation. The primary product of this model integration will be a capability for assessing and understanding the sensitivity of boreal ecosystem carbon and nitrogen pools and fluxes to climate variability. The proposed modeling research program will be coordinated with the BOREAS field measurements program. Field measurement at BOREAS sites will be used to test and validate our model. Our model will provide conceptual framework for testing which components of the boreal ecosystem are especially sensitive to climate change. The results of the combined field and studies will provide a sound rationale for the design and implementation of a ?? measurement program in the boreal forest ecosystem using the Earth Observing System (EOS).

P.I.(s): CO-I(s):	Knox, R.G./NASA/GSFC Levine, E.R., Ranson, K.J., Goltz, S.M./NASA/GSFC
Title:	Multidiscipline Integrative Models of Forest Ecosystem Dynamics for the Boreal Forest Biome: Modeling Gas and Energy Fluxes from Landscapes
Objectives and Approach:	<ul> <li>This effort is collaborative with TE-22 which has as its objective the development of a model-based synthesis of the influence of water and nutrients on forest community composition, and of evaluating the feedback from community composition to surface biophysical characteristics for the BOREAS project. The models involved in this synthesis are:</li> <li>1. ZELIG, a spatial individual tree model. ZELIG is currently part of the FED model;</li> <li>2. FED, a model shell allowing the interfacing of several different models of forest ecosystem dynamics and, hence, several different ecosystem processes;</li> <li>3. HYBRID, a combination model including forest growth; canopy physiology; and soil moisture, carbon and nutrients (see Friend, Shugart, and Running, 1993);</li> <li>4. Residue, a physical, multilayer soil temperature and moisture model (Bidlake et al. 1992).</li> </ul>
	The ZELIG and HYBRID models will be parameterized and implemented for the BOREAS test sites, and will be used to project the composition and canopy structure of forests over relatively long time spans for different regions. This will also provide a capability to predict CO <sub>2</sub> and H <sub>2</sub> O fluxes from the forests. ZELIG predictions of forest structure will be related to results of remote sensing (in collaboration with RSS-15) and compared with field data from soil and stem maps and auxiliary sites. Simple transport models will be used to relate spatio-temporal variation in flux predictions, from the combination of HYBRID and Residue, to temporal variation in tower flux measurements.

P.I.(s): CO-I(s):	Running, S/Univ of Montana Nemani, R./Univ of Montana, Peterson, D., Dungan, J., Coughlan, J/NASA Ames Research Center, Harding, D. NASA/GSFC. Wood, E./ Princeton Univ, Scuderi, L./Boston Univ, Price, A.,Carleton, T./Univ of Toronto
Title:	Simulation of Boreal Ecosystem Carbon and Water Budgets: Scaling from Local to Regional Extents
Objectives and Approach:	To simulate boreal landscape/atmosphere exchange processed and the scaling behavior of these processes from local to regional extents. Our emphasis is boreal ecosystem water and carbon flux processes, which will be simulated using a suite of models based on the processes of photosynthesis, respiration, evapotranspiration and surface and subsurface hydrologic flow. The implications of model and data generalization on the agreement between simulated and measured flux rates will be explored by constructing a hierarchy of modeling and surface parameterization methods. Each level in the hierarchy will vary in the degree of complexity of process and surface representation. The set of computed surface flux rates in combination with flux rates measured by other science groups will be used to quantify the impact of process and parameter generalization in terms of model bias at each level of the hierarchy, and the scaling behavior of flux

processes computed over the range of parameter resolutions we will sample. We hypothesize that the spatial patterns of surface/atmosphere flux is strongly influenced by the distribution of available soil moisture and inundation areas in the study sites, which, in conjunction with disturbance regime, may provide a key organizing framework for scaling stand to regional simulations. We will develop surface parameter sets for the models with a combination of field measurement of hydrologic processes, remotely sensed canopy information and laser and radar altimetry.

Title:	Multidiscipline Integrative Models of Forest Ecosystem Dynamics for the Boreal Forest Biome
Objectives and Approach:	The development of a model-based synthesis of the influence of water and nutrients on forest community composition, and of evaluating the feedback from community composition to surface biophysical characteristics for the BOREAS project. The models involved in this synthesis are: 1. ZELIG, a spatial individual tree model. ZELIG is currently part of the FED model; 2. FED, a model shell allowing the interfacing of several different models of forest ecosystem dynamics and, hence, several different ecosystem processes; 3. HYBRID, a combination model (see appendix C) including ZELIG, a photosynthesis model and a coupling with a canopy biophysical model (GBC, Running and Coughlan 1990); 4. SiB, a canopy water and heat balance model designed for interfacing with larger scale meteorological models. The ZELIG and HYBRID models will be parameterized and implemented for the BOREAS test sites, and will be used to project the composition and canopy structure
	of forests over relatively long time spans for different regions. This will also provide a capability to predict $CO_2$ and $H_2O$ fluxes from the forests. Several of the data sets being developed in conjunction with the BOREAS project will be implemented to test these model implementations. An important aspect of the project will be the incorporation of outputs and inputs of the SiB models with the other models to provide an interfacing of the terrestrial forest dynamics with the feedbacks to and from the atmosphere.

Title:	Canopy Architecture of Boreal Forests: Studies of Solar Radiation, Leaf Area Index, and Forest Dynamics
Objectives and Approach:	<ul> <li>The primary goal of this project is to characterize canopy architecture as it influences within-canopy solar radiation regimes, with implications for forest ecosystem dynamics and remote sensing. The project will also provide indirect estimates of fPAR and LAI, measurements of canopy surface topography, and detailed maps of stand architecture. Hemispherical (fisheye) photography will be used 1) to measure the angular distribution of canopy openings, 2) to estimate fPAR, and 3) to estimate LAI and leaf inclination for the BOREAS project study sites (tower flux, auxiliary, and mixed boreal forest sites). Acquisition of arrays of hemispherical photographs will permit examination of horizontal variation within each site and vertical variation in the understory and throughout low canopies. Photographs taken from towers will permit examination of complete vertical profiles for Tower Flux and TE Tower Sites. Estimates of fPAR (direct, diffuse, and total) from photographs will be validated using PAR sensor measurements, while LAI and leaf inclination estimates will be validated using both direct and indirect methods. Field measurements, construction of detailed stand maps, and analyses will be coordinated with TE-9, TE-13, TE-20, RSS-7, RSS-19, BOREAS staff efforts and Canadian contributions to biometric measurements.</li> <li><b>THE-23 SCHEDULE</b></li> <li>May 16-18 Northern Study Area (Rich + 2 assistants) set up mapped forest plots at all sites</li> <li>May 16-18 Northern Study Area (2 assistants) hemispherical photography at all sites</li> <li>June 6-16 Northern Study Area (2 assistants) hemispherical photography at all sites</li> <li>June 17-July 11 Auxiliary Sites hemispherical photography, characterize sites</li> <li>July 15-18 Southern Study Area (2 assistants) characterize mapped plots at all sites</li> <li>July 15-18 Southern Study Area (2 assistants) characterize mapped plots at all sites</li> <li>July 15-18 Southern Study Area (2 assistants) characterize mapped plots at all sites</li> <li>July 15-18 So</li></ul>

Title:	Magnitude and Control of Trace Gas Exchange in Boreal Ecosystems	
Objectives and Approach:	We propose to examine the role of boreal soils in trace gas exchange with the atmosphere. There are three objectives to this study:	
	Objective 1: To quantify the exchange rates of CO, $N_2O$ , CO <sub>2</sub> and especially CH <sub>4</sub> with representative, drained upland soil sites in the boreal forest over an entire biological "active" season.	
	Objective 2: To quantify the relative contributions of upland soils and lowland beaver ponds and their associated wetlands in the regional $CH_4$ cycle.	
	Objective 3: To develop techniques that will allow confident scaling of flux measurements from local to landscape to regional scales.	
	Deliverables:	
	Direct measurements of exchange rate of $CH_4$ , $N_2O$ , $CO_2$ and possible CO using enclosures at three or four upland sites that will be defined principally by soil type and moisture regime. Concentration profiles of these gasses in the soil will also be measured at the same time. Empirical diffusion versus moisture curves will be developed with SF6 uptake in a variety of soil types (with TGB-3, TGB-4 and TE- 3). We will also quantify $CH_4$ effluxes from wet beaver flooded sites in close collaboration with TGB-4 (Roulet). At least one each of the upland and wetland sites will be in very close association with micrometeorology / flux towers where we propose to make very previse, quasi-continuous ambient $CH_4$ concentration measurements at multiple levels.	
	Needs from other science groups (incomplete list):	
	The successful attainment of all of the objectives of this proposal requires soil climate monitoring (temperature, moisture, heat flux, etc. with TGB-4 and TF-8), soil physical and chemical characteristics (with TE-3), beaver pond tower and momentum transfer coefficients to calculate fluxes from the measured CH <sub>4</sub> gradients at the beaver pond (with TGB-4). For the scale aspects of the study we need remote sensing of surface soil type and its moisture and associated (with enclosure flux studies) micronet tower physical and chemical fluxes.	
	Needs from project staff (incomplete list):	
	Housing and transportation (pickup truck) for three, source of chromatography grade fuel, air and carrier gasses for the gc's, at least ten feet of lab bench space, clean power. For the automated systems, we need a maximum of ten amps current (usual draw is about three) and about four feet of a standard 19 in. instrument rack, gasses.	
	Location: Nelson House Sites: Old Black Spruce, Old Jack Pine, Beaver pond and Jack Pine-auxiliary Duration: May-September, 1994 Measurements: half-hourly - gradients of CH <sub>4</sub> concentration (BP and OJP)	
N F2		

once/4 -6 d- CH<sub>4</sub>, CO<sub>2</sub> (dark ), CO, N<sub>2</sub>O, flux for 20 runs with enclosures at 6 to 8 collar locations/site (OBS,OJP)

episodic-SF6 diffusion experiments with flux measurements during the IFC's we will work with TGB-4 for extensive regional surveys of  $CH_4$  and  $CO_2$  fluxes from beaver ponds

Measurements expected from other groups: - <sup>222</sup>Rn profiles - TE-3 - (Trumbore) -physical and chemical characterization of soils at sites (Harden) -del <sup>13</sup>CH4 and del <sup>13</sup>CO<sub>2</sub> from soil flux (TGB-6, TE-3) -soil moisture and temperature measurements at each site

P.I.(s):	Moore, T.R./McGill Univ, Knowles. R./MacDonald Campus of McGill Univ
Title:	Carbon Dioxide and Methane Exchanges Between Wetland and Upland Soils and the Atmosphere, Southern Boreal Forest
Objectives and Approach:	At sites representing the range of wetlands in the Nelson House area, we shall measure methane emissions by a static chamber method. Emission rates will respond tochanges in the thermal and hydraulic regimes of the soils, and used to test predictive models based on vegetation, water table or mechanisms. Carbon dioxide and methane fluxes will be measured from upland soils at the major sites, and related to microbial and environmental characteristics, as well as vegetation (e.g. post-fire succession). Samples of peat and upland soils will be incubated under lab conditions to establish the major controls on microbial production or consumption of these gases. Measurements will be made at approximately weekly intervals from late May to September 1994. DOC concentrations in soil water and streams will be measured to provide an estimate of DOC flux within the C cycle.
	Deliverables:
	Fluxes of methane from wetland soils in the region (using vegetation and remote sensing to scale up or point measurements), as well as sites of methane exchange within the tower footprint. Fluxes of methane by upland soils, within the tower footprints, as well as major
	forest types. Fluxes of carbon dioxide from the forest floor of upland soils, combining decomposition and root respiration, within the tower footprint, as well as different vegetation types.
	Relationships between the climatic variables, such as temperature, precipitation, and water table position and gas flux. Sources and sinks of DOC at selected sites at Thompson and DOC export from small catchments draining different terrain types.
	Needs:
	Ecological attributes of the upland sites (we can deal ourselves with the wetland sites), as well as thermal and hydrologic regimes. Remote sensing characterization

of the sites will be useful in any attempt to scale up, and we may also be able to use some of the more detailed low-level information collected to see if we can recognize some of the smaller-scale variability in vegetation and microtopography which will influence gas flux rates. We may wish to include some of the Prince Albert wetland and upland soils in the incubation studies, to provide a wider comparison and applicability of the results.

From the Project Staff, we expect:

1. Provision of spurs to the measurement sites along the fen boardwalk.

2. Provision of wood and materials to build small boardwalks/platforms at other wetland sites where disturbance will be a problem.

3. Provision of laboratory facilities in Thompson; central GC lab with other TGB members, plus drying oven, balance and other basic laboratory equipment. Accomodation at Thompson needs to be resolved by late summer, 1993. We shall probably have a truck at Thompson for the period, but will need access to ATV for equipment transport occasionally.

Location: Nelson House

Sites: Wetland-fen (tower site), palsa, collapse scars of bog, intermediates fen and rich fen

Upland-Young Jack Pine (tower site), mature spruce-moss forest (2); mature aspen stand; 30 year burn of spruce-moss and aspen stands; possibly more recent burn sites.

Duration: May-September 1994

Measurements:

Weekly -  $CH_4$ , flux using enclosures at wet sites; Water table,;temperature profiles; Soil  $CO_2$ , and  $CH_4$ , exchange using enclosures at dry sites; Soil pore  $CO_2$ , and  $CH_4$  profiles

Occasionally - samples of soils from wetland and upland sites for  $CH_4$  production and consumption and  $CO_2$  production studies. (to be collected August 1993). Soil samples for microbial studies of  $CH_4$  dynamics. Role of plants in  $CH_4$  and  $CO_2$  flux through experimental manipulations and rhizosphere analyses.

Measurements expected from other groups:

- -- Soil characterization at upland sites (???)
- -- Soil moisture and soil temperature at upland sites (???)
- -- Possible collaboration with PA, CH<sub>4</sub> flux groups (TE-1, TE-11) for methane production/consumption potential of soils.

P.I.(s):	Roulet, N.T./York Univ
Title:	The Fluxes of Energy and Trace Gases from Beaver Ponds and Dry Upland Forest Floor in the Northern BOREAS Field Site
Objectives and Approach:	The primary objective of the proposed research is to quantify the exchange of heat, water, and $CH_4$ between boreal forest beaver ponds and the atmosphere for the ice free period of BOREAS. The fluxes of heat, water and $CO_2$ from one beaver pond will be measured continuously using the energy balance Bowen ratio approach. The diffuse and bubble flux $CH_4$ will be measured several times a week using chambers. The chamber approach will be used to sample $CO_2$ and $CH_4$ flux from 4 to 5 additional beaver ponds, once every two weeks, and regional survey of the surface concentrations of $CO_2$ , $CH_4$ , and DOC will be carried out on accessible beaver ponds once during the IFC. The results of this work will be extrapolated from the local to regional scale in collaboration with the remote sensing project of J. Miller (York University - separate proposal). The secondary objective of the proposed research is to study the soil climate and soil characteristics at a forest site in conjunction with the flux studies of P. Crill (UNH). Soil moisture and temperatures will be measured continuously, and soil porosity will be determined.
	Deliverables to the project: 1. Continuous record of heat, water and $CO_2$ flux from one beaver pond; 2. Frequent measurements of $CH_4$ flux from the same pond, 3. Bi-weekly fluxes of $CO_2$ and $CH_4$ from up to five beaver ponds; 4. A spatial survey of surface concentrations of $CO_2$ , $CH_4$ , and DOC from accessible beaver ponds; 5. Continuous record of soil moisture and temperature and water levels from one forest soil site.
	Needs from other science groups: Areal extent of beaver ponds - preferably the frequency and size distribution of; and 2. isotopic composition of CH <sub>4</sub> from beaver ponds .

Title:	Trace Gas Exchange in the Boreal Forest Biome: Effects of Fire and Beaver Activity
Objectives and Approach:	This proposal describes a three year interdisciplinary effort to examine the effects of fire and beaver activity on trace gas fluxes and biogeochemical processes in burned soils and oxic zones of beaver ponds in the boreal biome. Specifically, the post-burning effects of fires on soil fluxes of trace gases (CH <sub>4</sub> , CO, CO <sub>2</sub> , N <sub>2</sub> O and NO) will be determined in upland black spruce and jack pine ecosystems located in and near the BOREAS Northern Study Area (NSA). A mathematical model (CENTURY), which has been developed to simulate trace gas biogeochemistry in forest soils, will be modified to include the effects of fires in these ecosystems. Other studies will focues on trace gas biogeochemical processes that affect organic matter cycling in the oxic zones of beaver ponds in the NSA. In conjunction with studies proposed to BOREAS by TGB-4 on methane and carbon dioxide fluxes, we propose to obtain a data set of CO flux measurements in selected beaver ponds and other wetlands with ancillary data relevant to process models that describe carbon cycling in these ecosystems (e.g., microbial and organic matter characterization, solar spectral irradiance). Field and laboratory studies will be

conducted to develop an understanding of microbial and photochemical processes that produce and consume CO and  $CO_2$  in baver ponds and other wetlands of the boreal biome.

#### **Deliverables:**

Soil-atmosphere exhange rates of carbon dioxide, methane, carbon monoxide, nitrous oxide, and nitric oxide will be determined in burned upland black spruce and jack pine forests and in nearby unburned control sites in the NSA. Carbon monoxide fluxes, organic matter characterization, and microbial carbon cycling data will be obtained in active beaver ponds. These data will be submitted to BORIS within one year after sample collection on floppy disk in the DAFT format specified by BORIS. Experimental resits and data interpretation will be presented in annual progress reports and peer-review publications.

#### Needs from other science groups:

Trace gas flux data from upland forest sites in the NSA that have not recently been burned (TGB-1, TGB-3) are required as control data for ourproject. We will also need meteorological (e.g., windspeed) data and measurements of other physical factors that control air-water gas exchange from TGB-4. We also need <sup>222</sup>Rn flux data and soil physical and chemical data.

#### Needs from Project Staff:

Our project will require the following Core Measurement that we anticipate obtaining from BORIS for model development and experiments.

Climate information: monthly precipitation; monthly averaged maximum daily temperature; monthly averaged minimum daily temperatures; nitrogen deposition estimates (wet and dry), windspeed, barametric pressure solar radiation.

Soil properties: soil texture (% sand, silt, and clay content); soil organic matter content by depth (C, N, and P); pH, cation exchange capacity, base saturation, bulk density of soils; landscape variation in soil properties or regional distribution of soils, nitrogen species.

Plant characteristics: biomass estimates by month of growing season above and below-ground production estimates chemical analysis of plant components (C, N, % lignin). We also request that project staff provide us with logistical support for the IFC's, planning for and managing the operations of the IFC's and organizing BOREAS Science Team meetings and workshops.

#### Location: NSA

Sites: mostly auxiliary recent burn sites (< 15 yrs) (total of 5; 4 upland black spruce, 1 jack pine); work on 2 beaver pond sites in NSA Duration: May to September

#### Measurements:

Weekly -  $CO_2$ ,  $CH_4$ , CO,  $N_2O$ , NO fluxes using enclosures (6 collars/site). Vertical profiles of  $CO_2$ ,  $CH_4$ , CO, at selected soil depths at burn sites and at nearby unburned controls.

Weekly - SF<sub>6</sub>, exchange studies to determine soil diffusivities at burn sites and nearby unburned controls.

Determination of fire characeristics; nature of fire; age of trees at time of burn, burn frequency at site, extent of organic layer removal; dominant species (trees, moss ground cover) at time of fire and at time of soil flux measurements.

#### Occasionally

-- water chemistry at the 2 beaver ponds

DOM characterization in beaver ponds
Process studies on oxic zone in beaver ponds
Photochemical CO production studies from pond water
WeeklyConcentrations of CO above pond water surface and at various depths below water surface measured hourly; fluxes of CO measured using floating quartz enclosures.
<ul> <li>Measurements expected from other groups:</li> <li>222Rn concentrations/fluxes at various depths in soils</li> <li>Soil carbon content and above-and below-ground biomass densities at various burn sites and at nearby unburned controls</li> <li>Solar spectral irradiance (including UV-B and UV-A)</li> <li>Physical and chemical characterization of soils at burn sites and nearby unburned controls</li> <li>Input variables for CENTURY model</li> </ul>

P.I.(s):	Wahlen, M./Scripps Institution of Oceanography
Title:	Isotopic Composition of Methane Produced and Consumed in Boreal Ecosystems
Objectives and Approach:	We propose to determine the isotopic composition (d <sup>13</sup> CH <sub>4</sub> , dD in CH <sub>4</sub> and <sup>14</sup> CH <sub>4</sub> ) in methane emitted to the atmosphere from the boreal forest ecosystems, so that this source, together with the net flux, can be considered in a global isotopic methane budget. We also intend to study the relative importance of methane production versus methane consumption by oxidation in these ecosystems, using the stable isotopes (d <sup>13</sup> CH <sub>4</sub> and dD in CH <sub>4</sub> ) as tracers. The isotopic fractionation induced by methane oxidation will be determined. If bacterial methane oxidation is a substantial sink globally (compared to the atmospheric sink) the isotopic consequences of this sink should be determined. Investigations of the dD for methane will allow to determine the split in methane production from acetate fermentation and CO <sub>2</sub> reduction in these ecosystems. Furthermore, we propose to analyze the <sup>14</sup> C in the methane emitted from these sites, to investigate the age of the stored carbon, and, to find out if releases of methane highly depleted in <sup>14</sup> C could reconcile the discrepancy between statistical estimates for fossil methane releases and those derived from measurements of <sup>14</sup> C <sub>4</sub> .
	and of carbon dioxide exchanged with the atmosphere at 3-6 sites from the norther

and of carbon dioxide exchanged with the atmosphere at 3-6 sites from the norther and southern study areas. Measurements of these quantities in background air.

#### Cooperation:

Flux determinations will not be made by our group but will be coordinated with those of Crill, Ehleringer, Moore, Roulet, Trumbore and Verma. Samples will be taken using chambers established by these investigators. This will maximize the background data in support of the isotopic determinations.

Needs from Project Staff: Limited storage space for field sampling equipment and pressurized A1 taks prior to and after deployment.

Sites:	Nelson House and Prince Albert PA Young jack Pine, Old Jack Pine, Fen, NH Young and Old Jack Pine, Old Black Spruce, Fen, Beaver Pond, Jack Pine-Aux, Fire sites. IFCs 1994

P.I.(s):	Waite, D.T./Environment Canada
Title:	Atmospheric Transport of Agricultural Pesticides into the Boreal Ecosystem
Objectives and Approach:	We propose to measure the deposition in the boreal forest of seven herbicides (2, 4-D, bromoxynil, dicamba, MCPA, triallate, trifluralin and diclop-methyl) known to appear in the atmosphere of the Canadian prairies, three herbicides (atrazine, alaclor and metlaclor) commonly used in the central United States and known to be deposited in precipitation in the forest and three groups of insecticides (toxaphene, lindane and breakdown products and DDT and breakdown products) reported from the literature and from unpublished data to occur in boreal and arctic food chains. Deposition will be measured in rain and dry fall-out (gases, colloids and particles) using a new sampler designed and built by Environment Canada specifically for pesticide and trace organic work. Ambient air samples will be collected using currently available high volume PUF samplers. Sampling locations will be; 1 - Regina atmospheric study site (source of herbicides originating in prairie Canada); 2 - BOREAS site in Saskatchewan (southern boreal forest); 3 - Yellowknife NWT Env. Can. site (northern boreal forest); 3 - Yellowknife NWT Env. Can. site (northern boreal forest); 4 - Inuvik AES meteorological station (northernmost boreal forest site); and, 5 - Iqaluit (a remote site on the eastern arctic). Sediment core samples will be collected from Great Slave Lake (Yellowknife) in the winter of 1992 and from either Montreal L. or Waskesiu L. (BOREAS) in the winter of 1993. The cores will be sectioned and analyzed for the same pesticides as the atmospheric samples. The result will be a measurement of yearly deposition rate of pesticides.

P.I.(s):	Monson R./Univ of Colorado
Title:	The Relationship Between Non-Methane Hydrocarbon Emission and Leaf Carbon Balance in the Boreal Forest: An Approach for Mechanistic Ecosystem Modelling
Objectives and Approach:	We propose to investigate the mechanistic controls over non-methane hydrocarbon (NMHC) fluxes from boreal forest trees. The studies will be used to modify existing ecosystem models to include NMHC emissions and their response to seasonality and resource variability (primarily water and nitrogen). The proposed research is ordered around three general questions: (1) To what extent are leaf carbon balance and isoprene synthase activity (the enzyme responsible for isoprene emission) predictors of NMHC flux?, (2) How do leaf carbon balance and isoprene synthase activity depend on nitrogen/water availability and carbon source/sink parameters?, and (3) How do we modify the FOREST-BGC ecosystem model based on questions 1 and 2, to predict canopy-level NMHC fluxes? Studies will include seasonal monitoring of NMHC emissions and its relationship to plant phenology, photosynthesis, respiration, isoprene synthase activity, and leaf starch concentrations. Fertilization and irrigation of some plots will be conducted to discern the relationship of NMHC emission and leaf carbon balance to resource availability.
	Manipulation of branch source/sink balance will be performed in a bud-removal experiment. The latter experiment aims to unequivocally demonstrate the role of carbon balance in regulating seasonal emissions patterns. Studies will be conducted to examine the relationship between monoterpene production versus emission. This will focus on the potential for emission variation due to differential vapor pressures of the dominant monoterpenes. Finally, algorithms will be produced to modify FOREST-BGC to provide mechanistically-based predictions of ecosystem MNHC emissions as linked to carbon balance.
	Deliverables: Data sets to be contributed to BORIS include seasonal measurements of leaf/needle photosynthesis rate, transpiration rate, stomatal conductance, hydrocarbon emission rate, leaf/needle nitrogen concentrations, leaf/needle starch concentrations (dawn and dusk), needle monoterpene concentrations, and seasonal plant water potential patterns, on aspen and black spruce at the Prince Albert Park site.
	Needs from other groups: Access to sampling towers and possibly daily access to a gas chromatograph for gas sampling from approximately 12 stainless steel containers (access to the latter is flexible measurements can be conducted at night).
	Needs from Project Staff: More money.
	Location:Prince AlbertSites:Black Spruce and AspenDuration:IFCs 1994
	Measurements: (all done on upper canopy - sunlit leaves or needles)
	Daily:

- -- am/pm photosynthesis rate for aspen and black spruce leaves
- -- am/pm/evening starch and nitrogen content in spruce and aspen tissue
- -- leave water potentials (pre-dawn and midday) each day during IFC.

#### Occasionally:

- -- Tissue concentration and flux rate of monoterpenes for black spruce.
- -- Isoprene emission rate for black spruce and aspen.

Measurements expected from other groups: None.

P.I.:	Niki,H./ Hastie, D./York University
Title:	Ambient Measurements of Ozone, Nitrogen Oxides and Non-Methane Hydrocarbons
Objectives and Approach:	An intensive ground based measurement campaign of ambient concentrations of biogenic and anthropogenic $C_2$ - $C_{10}$ non-methane hydrocarbons at one of the Intensive Study Sites over the course of the 1994 experiment year, with full participation in the Intensive Field Campaigns (IFC) and possibly in the Focused Field Campaign during the spring thaw. A weekly to twice weekly hydrocarbon sampling schedule is envisioned through the years 1993, 1994 and 1995 to provide season distribution data on these hydrocarbons.
	Air samples will be collected in stainless steel canisters, filled and pressurized using a portable battery operated pumping unit, and either returned to York University for analysis or analyzed on site in our mobile laboratory. Analysis methodology has been developed already. A gas chromatography (GC)-based method is being employed involving cryogenic (liq. Ar) sample preconcentration on glass beads, and cryogenic (liq N <sub>2</sub> ) sample focusing onto the CG column head. Separation of C <sub>3</sub> -C <sub>10</sub> hydrocarbon range is done while C <sub>2</sub> -C <sub>6</sub> hydrocarbons are analyzed on an Al <sub>2</sub> O <sub>3</sub> /KC1 PLOT column.
	Air samples will be collected with the intent of itemizing the biogenic hydrocarbon inventory of the boreal forest ecosystem, as well as to determine the relationship between ambient concentrations and factors controlling their emission rates such as temperature and insolation. Spatial distribution will also be investigated in order to better understand the effect of vegetative composition, forest stand age, and plant stress on the hydrocarbon constituency of forest air. Samples collected on a weekly basis throughout the 1993-1995 period will provide a unique continental, chemical climatological record of key trace gases prominent in the global atmosphere such as ethane, propane and benzene. These species are indicative both of the atmosphere's oxidizing potential and pollutant loading due to long range transport.
	Deliverables to the Project: Ambient data of non-methane hydrocarbons during the study period.
	Needs from Other Science Groups: Collection of air samples in stainless steel canisters (3 litre).

Needs from Project Staff:

Collection and shipping of air samples in stainless steel canisters to and from York University in Toronto.

Location: Prince Albert (some Nelson House) Sites: Young and old aspen, black spruce, pine Duration: August 1993, mostly IFCs 1994.

#### Measurements:

Continuous:

- -- Hydrocarbon flux at black spruce, aspen, for half of each IFC, 3 1/2 hour periods/day.
- -- Gradients on each flux tower including NH, 3/day during IFCs.

## Daily:

- -- Hydrocarbons  $C_2$   $C_{10}$ , 6/day, old aspen, IFCs (Westburg, Zimmerman)
- -- Hydrocarbons grab sample, IFCs, two daily.
- -- Hydrocarbon profiles in lower BL, two daily during IFC.
- -- Aldehyes and organic acides, 2 to 6/day

#### Twice Weekly:

-- Hydrocarbons grab sample, year round, old aspen (Niki)

#### Occasionally:

- -- Hydrocarbon flux, species survey during IFC, pine, spruce, aspen.
- -- Aircraft hydrocarbon flux on Twin Otter, 9/flight during IFC for a total of 20 to 30 on specific flights.
- -- Aircraft hydrocarbon flux on Electra, 8/flight during IFC for a total of 20 to 30 on specific flights.
- -- CH<sub>4</sub> fluxes at tower sites, where needed.

Measurements expected from other groups:

- O<sub>3</sub>, COS, CO, NO<sub>x</sub>, CCN concentration in troposphere.

P.I.:	Westberg, H./Washington State University
Co.I.:	Hewitt, Nick./Lancaster University
Title:	Measurement of Biogenic Hydrocarbon Fluxes and Surface Exchange Processes in a Boreal Forest
Objectives and Approach:	We will measure 1) biogenic hydrocarbon emission fluxes, 2) oxidant deposition rates (ozone & hydrogen peroxide), 3) boundary layer exchange rates (via concentration gradient measurements and tracer studies), and 4) diurnal ambient concentration patterns of VOC's and oxidants. These data will be used to determine the role of biogenic hydrocarbon emissions with respect to carbon cycles in the boreal forest and to examine the atmospheric chemical fate of boreal biogenic emissions. Measurements of oxidant deposition rates will be used to investigate feedback mechanisms between atmospheric chemical cycles and forest dynamics.
	We will measure Hydrogen peroxide and organic peroxides in ambient air at the southern Prince Albert field site during the July 19-August 8, 1994 second field intensive. Our objective is to examine the hypothesis that VOC emissions from the biosphere contribute to peroxide formation in the atmosphere. We will collaborate closely with Dr. Hal Westburg, Washington State University, in this.
	Deliverables: These measurements will be provided to the project in terms of tabulated emission fluxes (by tree species and compound type), emission algorithms, vertical concentration profiles, boundary layer transport properties, oxidant deposition rates, and ambient concentrations of each measured species as functions of time and location. Peripheral environmental data will also be included.
	Needs: Needs from other science groups will include vegetation surveys, biomass surveys, CO <sub>2</sub> exchange rates, boundary layer depth measurements, and associated meteorological parameters.
	Needs from the Project Staff: Assistance with the arrangements of access and logistics.
	Location: Prince Albert Sites: Old aspen, black spruce, old jack pine. Duration: IFCs 1994.
	<ul> <li>Measurements:</li> <li>Daily:</li> <li>Biogenic hydrocarbon flux at black spruce, old aspen and old jack pine during each IFC three 1/2 hr periods/day</li> <li>Biogenic hydrocarbon gradients on the three flux towers, 3/day during IFcs</li> <li>Ozone and H<sub>2</sub>0<sub>2</sub> gradients at old jack pine site, IFCs</li> <li>Ambient hydrocarbon (C<sub>2</sub>-C<sub>10</sub>) grab samples, IFCs, 6 daily</li> <li>Hydrocarbon profiles in lower BL, two daily during IFC</li> <li>Aldehyde and organic acid sampling, 2 to 6/day</li> <li>Ambient ozone and H<sub>2</sub>0<sub>2</sub></li> </ul>

Occasionally:

- -- Aircraft hydrocarbon flux on Twin Otter, 9/flight during IFC for a total of 20 to 30 on specific flights.
- -- Aircraft hydrocarbon flux on Electra, 8/flight during IFC for a total of 20 to 30 on specified flights.
- Measurements expected from other groups:
   -- CO, NO<sub>x</sub>, concentration in troposphere.

Input, Accumulation, and Turnover of Carbon in Boreal Forest Soils: Integrating $^{14}\mathrm{C}$ Isotopic Analyses with Ecosystem Dynamics
We will combine measures of carbon inventories of soils, <sup>14</sup> C content of soil atmospheres, and rates of soil respiration to estimate the rates of carbon accumulation and turnover in soils of each of the major vegetation types of the boreal forests at Prince Albert and Nelson House. <sup>14</sup> C measurements of physically and chemically fractionated soils will be used to partition soil organic matter into pools that turn over on annual, decadal-centennial, and millennial time scales. The understanding of soil carbon dynamics gained from these estimates will be tested against evidence from (1) chronosequence studies which document the accumulation of carbon in physically and chemically defined pools on decadal (time since fire) and millennial (time since soil formation) scales, and (2) estimates of rates of soil respiration and <sup>14</sup> C content of respired CO <sub>2</sub> . We will explore several of the factors controlling soil carbon accumulation and dynamics, including (1) quality of the detrital substrate, and (2) availability of O <sub>2</sub> as expressed by soil moisture, gas exchange rate, or drainage class. Measurements will be coordinated with those of other investigations to maximize the amount of information gathered at each site. Data: 1) <sup>14</sup> C measurements of fractioned organic matter from archived soil profiles are
collected during 1993-4 field seasons.
2) Isotopic composition of CO <sub>2</sub> fluxes and soil atmosphere concentrations
3) Measures of soil gas exchange rate (from 222Rn) at the same site. Sites will be selected to augment information being gathered by other investigators, and will include both primary tower sites and auxiliary sites selected to study processes in trace gas geochemistry.
4) We will also provide C inventory data for sites we measure, including soil bulk density, and organic carbon content.
5) Form data synthesis: Model of carbon cycling including the effect of moisture and litter quality on decomposition rates.
Needs from other groups:
N-64

Litterfall and root turnover estimates

--Soil moisture data/ysimeter to sample TDOC DOC --Soil Characterization (eg. grain size, CEC, etc.) (can be done by our project with more resources

Needs from project staff

--Logistics, as we will be sampling all three BOREAS sites

Title:	Coupled Atmosphere-Forest Canopy-Soil Profile Monitoring and simulation
Objectives and Approach:	The objective of this project is to design a coordinated program of data collection for soil properties and soil monitoring over the BOREAS sites collaboration with ecosystem, hydrologic and staff scientists. Properties to be specified include texture, particle size distribution, soil water retention function. The resulting data set will be used for initialization, parameterization, and verification of simulation models in the fields of remote sensing, atmospheric modeling, ecological systems modeling, hydrology and simulation of soil physical process. In order to meet the needs of the various research items, the measurement program will be divided into the areas of (1) Core Measurement Program (b) IFC Soil Moisture Content, Water Table and Soil Property Monitoring, (c) Continuous Soil Moisture Content and Temperature Monitoring, (d) Surface Moisture Measurement, (e) Soil Profile Transect and (f) Soils data for Auxiliary sites. The second objective of this project will be simulation of soil physical processes will be parameterized using the data described above, and tested and verified using soil monitoring data collected at the BOREAS tower sites. The calibrated simulation models for infiltration, soil moisture redistribution, evapotranspiration, and drainage will then be available for prediction of the soil moisture state at locations of interest to researchers working at sites where only Core Measurement Program data are collected, as well as regionally over the BOREAS experimental domain for the predominant soil textures.

Title:	Validation of a passive Microwave Snow Water Equivalent Algorithm Using an Energy Balance Model
Objectives and Approach:	The surface meteorological data to be collected at the tower and ancillary sites will be used as inputs to an energy balance model to monitor the amount of snow storage in the boreal forest region. SWE derived from an energy balance model and in situ observed SWE will be used to compare the SWE inferred from airborne or spaceborne microwave data and to assess the accuracy of microwave retrieval algorithms. The major external measurements that will be needed are snowpack temperature profiles, and in-situ snow areal extent and snow water equivalent data.

P.I.(s):	Davis, R.E./U.S. Army Cold Regions Research & Engineering Lab
Title:	Distributed Energy Transfer Modeling in Snow and Soil for Boreal Ecosystems
Objectives and Approach:	The goal of this project is to model the spatial and temporal distributions of critical snow pack properties and processes at the scale up to the size of two intensive study sites to develop tools linking the model predictions to remote sensing. The three principal objectives of the project are: (1) to classify the Boreal forest biome based on the spatial distribution of three stands and vegetation, and establish land cover units which have similar attributes in the context of the upper and lower boundary conditions required by the energy and mass transfer model: (2) to extend an energy and mass transfer model of snow and soil to simulate the distributions of insoluable particles, and to incorporate the thermal effects of three wells over a large area: and (3) to identify the capabilities and limitations of remote sensing measurements to monitor the state of the snowpack. The study will focus on the winter and thaw periods, and on the relatively small spatial scale (e.g., plot or hillslope).

Title:	Determination of snow cover variations in the Boreal Forest using passive microwave radiometry.
Objectives: and Approach:	This study will investigate snow cover variations within and between the BOREAS study areas using passive microwave radiometry. It will involve algorithm development and validation to derive snow water equivalent and extent from passive microwave radiometer data, incorporating variations in surface land cover. Ground, airborne, and satellite data will facilitate scaling up to the satellite resolution. The effects of forest cover (density, type) on snow cover retrievals will be assessed and incorporated in the determination of snow cover variability. The use of passive microwave data in combination and optical and thermal IR data to improve snow cover retrievals will be explored. Although dry snow conditions are a priority, flights during a melting state are desirable as well.

P.I.(s):	Harding, R.J./Institute of Hydrology
CO-I's:	The Regional Representation of the Energy and Moisture Fluxes from Snow Covered
Title:	Areas in the BOREAS Experiment
Objectives and Approach:	This project will seek to characterize the energy and water vapor fluxes, as well as related properties (density, depth, temperature, melt) for forested and non-forested areas. Equipment will be set up in the winter FFC and run through to the Thaw FFC. Two sites will be operated in or near the Prince Albert Park area. One is above a mixed jack pine and aspen forest stand near Bear Trap Creek (this site is being run in conjunction with the NHRI GEWEX experiment). The second site is near the centre of Namekus Lake (750 m from the western edge). It may be necessary to move the lake site to a clear cut area to the NE of Waskisiu in the Thaw FFC. Eddy correlation and full set of meteorological measurements will be made. An extensive program of meteorological and SVAT modeling is planned to investigate the problems of aggregation of surface fluxes in a snow covered landscape. One and two dimensional boundary layer models will be used to investigate scales from 100m to 10km. A three dimensional mesoscale model will be used to aggregate from 10 km to 1000 km. This latter model will require extensive meteorological and ground cover data from the BOREAS study region. Improved snow parameterisations for GCM's will be one of the important products of this research.

P.I.(s):	Peck, E.L./Hydex Corp

Title:

Remote Sensing of Hydrologic Variables in Boreal Areas

Objectives and Approach: This project will utilize airborne gamma sensing to measure soil moisture (SM) in areas underlain with permafrost (northern site) and in forested boreal areas, and will cooperate with HYD-4 in the measurement of snow water equivalent (SWE). The airborne estimates of SWE and SM will be used with estimates from other investigators to prepare information about the distributions of SWE and SM for the BOREAS sites and to investigate the relationships of these site measurements to those observed on a regional scale. Intercomparison studies of estimates of SWE and SM by the airborne gamma and other remote sensing techniques will be conducted. Flight lines will be established in the vicinity of the northern and southern sites, and (possibly) along the transect between the two sites. The flight lines, which will be constrained to be along roads due to accessibility constraints for the ground truth data will be located within areas having six surface conditions, defined on the basis of vegetation type and age, soil type, and soil moisture. The airborne estimates of the snow water equivalent will be validated using surface snow surveys. Background flights and in situ soil moisture measurements will be performed during Fall 1993. Airborne snow measurements will be flown during Winter 1994 (probably February), and snow course and soil moisture measurements will be conducted during the thaw and port-thaw periods of Spring 1994. Airborne soil moisture measurements will be collected during the three summer IFCs. The primary needs of this project for external data collection are ground data on vegetation and soil characteristics.

P.I.(s):	Band, L.E./Univ of Toronto
Title:	Simulation of Boreal Ecosystem Carbon and Water Budgets: Scaling from Local to Regional Extents
Objectives and Approach:	This project is primarily a modeling effort, which will seek to describe the scaling behavior of water and carbon flux processes from local to regional extents. A suite of simulation models will be used to describe photosynthesis, respiration, evapotranspiration and surface and subsurface flow over a range of scales. The underlying hypothesis to be investigated is that the spatial patterns of surface-atmospheric fluxes are strongly influenced by the spatial distribution of soil moisture and inundation areas in the study sites, which, in conjunction with disturbance regime, are thought to provide the key to scaling from stand to regional simulations. The small scales to be modeled will be essentially hillslopes or subcatchments for which the spatial resolution will be 5-10 m; these subcatchments or hillslopes will probably be located in the vicinity of the tower sites to facilitate use of surface flux data to be collected there. The larger scale will be on the order of the size of the NSA or SSA site, with data resolution extending down to that of AVHRR. The primary external data requirements are for high resolution DEM data, particularly for the hillslope sites, and vegetation and soils data at resolutions comparable to that of the DEM.

Title:	From Micro-Scale to Meso-Scale Snowmelt, Soil Moisture and Evapotranspiration from Distributed Hydrologic Models
Objectives and Approach:	This project will seek to identify, through field measurements and computer model- ing, the space-time distribution of meltwater supply to the soil during the spring melt period, and the evolution of soil moisture, evaporation, and runoff from the end of the snowmelt period through freeze up. The snow modeling activity, being conducted by Lettenmaier and Marks, will consist of two components: The first will make use of existing "off the-shelf" models, to forecast the onset and spatial extent of snowmelt and meltwater supply to the soil column prior to the 1994 IFCs. The second phase will extend, implement, and verify a physically based energy balance snowmelt model of the two sites and will evaluate approaches to aggregating detailed snowmelt predictions and measurements based on the model to larger scales, up to the size of a rectangle of several hundred km containing the northern and southern sites. The soil moisture modeling being conducted by Soilis and Engman, is based on a grouped response unit method which will allow characterization of soil moisture, evaporation, and runoff for the entire northern and southern sites. The primary external data requirements of the project are for (1)

water period surface meteorological and energy flux data, (2) high quality DEM data, (3) vegetation characterization, at the scale of the DEM, (4) supplemental snow-free period precipitation data at the local (hillslope) scale, perhaps along selected transects.

Title:	Radiative Transfer Characteristics of Boreal Forest Canopies and Algorithms for Energy Balance and PAR Absorption
Objectives and Approach:	The objectives of the proposed study are 1) to characterize the multidirectional interactions of solar energy in various types of boreal forest canopies through intensive measurements and through modeling, and 2) to relate these characteristics to ecologically important biophysical parameters. Emphasis is given to the directionally-dependent absorption of photosynthetically active radiation (PAR) by the forest canopies and the directional reflection of the radiation from them (constituting the albedo). The goal is to develop the necessary understanding and subsequently the algorithms to use measurements from satellites to quantify the radiation regimes above and within the forest canopies to reliably interpret the biophysical state of the boreal forest ecosystem. BOREAS Objectives II and VII are directly addressed through this proposed study. Additional contributions are made to the observational components of Objective III.
	Our approach is to acquire comprehensive sets of angular spectral bidirectional radiance and reflectance measurements for boreal forest types under various sky conditions; diurnally and seasonally. These angular radiance distribution measurements will be made both above and at various levels within the canopies, including the forest floor, to characterize the complete radiative transfer within the forest canopy types. A suite of unique field radiometers, which are significantly enhanced, but patterned after the original Portable Apparatus for Rapid Acquisitions of Bidirectional Observations of Land and Atmosphere, or PARABOLA, multidirectional field radiometer, will be deployed on trams to simultaneously traverse and measure the directional radiance distributions at the multiple levels within and above the forest canopies, while suspended between towers approximately 30 - 40 m apart.
	The measurements will be used in the proposed study and other proposed BOREAS investigators to validate physically-based models. Using detailed 3D models, we will simulate bidirectional reflectance and transmittance measurements for different forest types (foliage density, crown shape and crown spacing) under different illumination conditions. These simulated measurements will be used in the Ahmad-Deering model to parameterize the coefficient of the scattering phase function, thus extending its applicability to non-homogenous scenes and heterogeneous canopies. The extended Ahmad-Deering model will then be validated using field observations. Particular emphasis will be given to assessments of the fraction of photosynthetically active radiation absorbed and related biophysical variables and forest albedo. The model will be provided to BOREAS investigators for accurate interpretation of satellite data. Furthermore, we will test an hypothesis from Sellers <i>et al.</i> (1992) that the bidirectional reflectances for PAR obtained at a solar zenith angle of 60 <sup>o</sup> provide a good estimate of the time-weighted mean fraction of absorbed PAR.

P.I.:	Irons, J./NASA
Title:	Dynamics of Canopy Photosynthesis and Stomatal Conductance in the Boreal Forest: A Study Using Airborne, Multi-Angle, Imaging Spectroradiometer Data
Objectives and Approach:	To obtain multi-angle, high spectral resolution reflectance data of important forestal components of a boreal landscape and relate these data to biophysical states (albedo, FPAR, leaf area index ). The Advanced Solid State Array (ASAS) system will be flown over representative sites in BOREAS to acquire the data. Radiative transfer models will be used in combination with the multi- angle data to develop algorithms for biophysical parameter estimation.

P.I.:	Walthall, C./University of Maryland
Title:	Biophysical Significance of Spectral Vegetation Indices in the Boreal Forest
Objectives and Approach:	The primary objective of this study is to test alternate hypotheses concerning the biophysical significance of Spectral Vegetation Index (SVI) variations in the boreal forest region. It is proposed to investigate if current approaches for spectral estimates of APAR are suitable for the boreal forest, and what biophysical attributes of the boreal forest vegetation gradient are revealed by spectral vegetation index measurements. Two alternate radiative transfer models are to be employed which realistically represent the end points between "turbid media" canopies and "geometric" canopies. These models provide estimates of both observed spectral reflectance and canopy APAR. Intensive laboratory, ground and helicopter field measurements will be acquired to provide accurate parameter specifications for the radiative transfer models as well as measurements which can be compared to the model calculations. Measurements will be carried out at both the Prince Albert and Nelson House study sites to evaluate variance in model parameters and radiance properties at each end of the gradient. SVI analysis using the normalized difference vegetation index (NDVI) and simple ratio indices will be investigated, as will alternative approaches using second derivative analysis of the spectral reflectance function. Satellite observations from Landsat will be evaluated to establish the SVI gradient present in the BOREAS region and consider the question of landscape heterogeneity in producing the observed SVI gradient. Measurements will be coordinated with other BOREAS investigators and BOREAS Staff Science Teams.

P.I.:	Curran, P./University of Swansea
Title:	Coupling Remotely Sensed Data to Ecosystem Simulation Models
Objectives and Approach:	The proposed research will consist of four phases. (i) Collection of i <i>n situ</i> forest biophysical/biochemical data at pre-selected plots within one of the prime study sites. A four week data collection program will be planned, the timing of which will coincide with the pilot intensive field campaign programmed for the summer of 1993. Destructive and non destructive measurements at all plots will include leaf nitrogen and chlorophyll concentrations, leaf area index, tree diameter at breast height and percentage canopy cover. (ii) Derivation and validation of relationships between remotely sensed data and forest attribute data. (iii) Use of these relationships to estimate those forest variables required to drive and validate Forest BGC over the 400-600 km <sup>2</sup> study area. (iv) Reporting of results.

P.I.:	Goel, N./Wayne State University
Title:	Boreal Forest Community Composition and Structure, Photosynthesis, Remote Sensing, Scaling and Net Carbon Flux
Objectives and Approach:	The overall objectives of this proposal are to address the following questions related to two quantitiesphotosynthesis and soil radiation absorptionfor boreal forest: (1) How important is the detailed architecture and species distribution in boreal forest canopy in determining these quantities and how do they vary as a function of season when canopy architecture undergoes changes? (2) Can we estimate them using a simpler equivalent model using surrogate parameters for canopy architecture? (3) Are these parameters correlated to each other under different canopy architectural conditions, and can one estimate photosynthesis using measurement of radiation absorbed by the soil? (4) Can one estimate photosynthesis using radiation leaving a canopy? In particular, how does the relationship between FPAR (fraction of photosynthetically active radiation) and NDVI (normalized difference vegetation index) depend upon the complex forest community and architecture? (5) How can one scale up their estimation for a large collection of heterogeneous canopies such as those found in boreal forest? (6) To what degree different forest stands can be differentiated by using remotely sensed data? and (7) Can one estimate the net carbon flux over the area covered by the BOREAS site by using a combination of vegetation models, scaling strategies, ground observations, and satellite images.

P.I.:	Williams, D./NASA
Title:	Modeling and Remote Sensing of Radiant Energy Interactions and Physiological Functioning in a Boreal Ecosystem
Objectives and Approach:	The Objectives of our research program are twofold :
	• to develop and validate a three-dimensional boreal forest canopy/atmosphere radiation model capable of simulating canopy reflectance, absorbance and atmospheric effects:
	• to develop and validate algorithms for estimating surface albedo, solar and photosynthetically active radiation absorbed by boreal forest canopies, solar radiation absorbed by the background and, boreal forest canopy photosynthetic and bulk conductance efficiencies from spectral, spatial and temporal patterns of surface radiance fields.
	The physical problem is posed as a 3D radiative transfer equation (RTE), describing the interaction of photons in the atmosphere/vegetation medium, the solution of which is the remote spectral measurement. We propose to develop models of boreal forest community at the BOREAS experimental sites suing fractals and computer graphics. These scenes will be digitized to parameterize the 3D RTE together with canopy and atmospheric optical data. The resulting within-canopy radiation regime and bidirectional reflectance factor (BRF) distribution above the canopy and atmosphere will be compared with experimental and satellite data ( <b>€</b> II.A). We propose to use the shoot as the fundamental element for needle canopies. The validated radiation model will be coupled to a leaf/shoot physiology model to estimate canopy photosynthesis and bulk stomatal conductance, and compared with field data. Algorithms for estimating surface albedo, solar and photosynthetically active radiation absorbed by the canopy and background, canopy photosynthetic and conductance efficiencies from spectral indices will be developed using the 3D model and validated with experimental data. The model will also be used to investigate several fundamental problems in remote sensing science with special reference to boreal forest canopies (effects of architecture, optics, atmosphere, wavelength, adjacency, spatial heterogeneity, stand mixture, scaling, etc.

Title:	Retrieval of Boreal Forest Leaf Area Index From Multiple Scale Remotely Sensed Vegetation Indices
Objectives and Approach:	We propose to develop and validate an algorithm that will allow the retrieval of the spatial distribution of LAI from remotely sensed vegetation indices. Field measurements of LAI and FPAR (fraction of Absorbed Photosynthetically Active Radiation) will be undertaken for major boreal forest species (jack pine, quaking aspen, black spruce) and stand types. For each species, stands with different percentages of forest cover will be studies. FPAR will be measured but for smaller spatial areas than LAI due to logistical constraints. Field measurements of

effective LAI will be taken both along transects and on a regularly spaced grid with the LAI-2000 sensor. For selected stands (YJP,OJP and OBS tower sites in both SSA and NSA), high frequency data (1 sample/cm) will be obtained from a LI-COR quantum sensor carried by a person walking along transects beneath the overstory to improve LAI calculations and to characterize the architecture of the canopy. The measurements of the moving quantum sensor will be used to calculate FPARThese field measurements will allow us to establish relationships between LAI, FPAR and remotely sensed radiances and their transformations including vegetation indices. These relationships will then be used to test the performance of spatial mapping of LAI by extrapolation.

An airborne CCD scanner MEIS (Multi-detector Electro-optical imaging scann) will be used to remotely sense the forest in areas that coincide with LAI-2000 measurements. The airborne instrument will be flown at different altitudes producing images with pixel sizes of 0.5m, 2 m and 7 m. Lower resolution images will be obtained from LANDSAT and/or SPOT and possibly from other remote sensing instruments available through other BOREAS studies. Techniques to analyze the image content at different scales (e.g. image degradation, texture and contextual analysis) will be used to study the relationship between LAI and transformed satellite radiances at various scales. We will also study the the influence of variable forest cover and the influence of variable understory and soil reflectances on these relationships. By using land cover classification techniques combined with image degradation techniques, we will investigate the possibility of extrapolating to the NOAA-AVHRR scales the relations obtained between vegetation indices from LANDSAT data and LAI from indirect field measurements. These techniques will allow us to address the scaling-up process of LAI from local to regional area measurement.

P.I.(s):	Running,S.W./Univ of Montana
Title:	MODIS Land Team (Moland) Alborithm Development for Boreal Forests: Participation in BOREAS
Objectives and Approach:	We plan two phases to our BOREAS participation. <u>First</u> , during the IFCs we plan to participate in ground validation measurements of: 1) land cover mapping of the northern and southern sites, using both TM data and MODIS airborne simulator (MAS) data with ground derived mapping. 2) mapping and satellite monitoring of the seasonal snowcover and snowmelt on both sites using MAS and ASAS sensors. 3) development of advanced spectral vegetation indices, predominantly using MAS and ground BRDF measurements. 4) surface temperatures, as monitored by the meteorological tower network planned for each site, and related to both aircraft and satellite measured thermal emmittances.
	We then plan to use carbon and water flux measurements taken from cuvette, tower and aircraft levels by other investigators to validate our hierarchichal modeling of ecosystem water and carbon balances done with FOREST-BGC and our current $\Delta$ NDVI modeling. We will integrate these core products into new spatially scalable estimates of daily photosynthesis-respiration balances, evapotranspiration, and soil decomposition and CO <sub>2</sub> production.

Our <u>second</u> phase of work will be to take these MODLAND products, tested and validated during the IFCs, and extrapolate them to the global boreal forest biome.

P.I.(s):	Strome, M.
Title:	High Spatial and Spectral Resolution Image Analysis Techniques for Ecological and Biophysical Data (HIGH SPIRITED)
Objectives: and Approach:	A major objective will be to attempt to develop techniques and algorithms to enable us to monitor changes in the test sites and to relate the remotely sensed data to forest models. The multi-temporal data will be used to attempt to monitor changes resulting from phenologic events, especially those related to vegetative stress where possible.
	The majority of past efforts to analyze high spectral resolution data have focused upon relatively simple signal processing techniques, such as selection of optimum bands to dinstinguish features of interest such as species identification, vegetative stress and defoliationdue to insect damage. Some techniques, used principally for giological applications, have looked at thepositions of peaks and valleys in the spectral signature. We intend to apply several other signal processing techniques to identify and extract features from the shape of the spectral signature. Some of these include the use of expert systems from the DEIDAM project, neural networks, and signal processing/information extraction techniques similar to those used in acoustics, magnetic anomaly detection and radar signal processing.
	Data required to conduct the research will include that collected on the ground by other scientists. We will also require complete AVIRIS data coverage of the test sites from three data as acquired for RSS-18. We wish to obtain raw data as well as radiometrically and geometrically corrected (preferably geocoded) data, as well as processed Global Positioning System (GPS) reference data. It would also be desirable to obtain CASI data in both high spectral and spatial mode if it is available from RSS-19.

Title:	Satellite Estimation of PAR and UV-B Irradiances and LONG TERM ESTIMATES OF TRENDS OF UV-B from Ozone Depletion and Cloud Variability at the BOREAS Sites
Objectives and Approach:	We Propose to investigate from ground and satellite observations the observations the magnitude of daily, seasonal and yearly variations of UV-B irradiance during the course of the BOREAS field experiment and to examine the 14 year record of Total Ozone Mapping Spectrometer data over the BOREAS sites for ozone and cloud reflectance variability. We also propose to estimate the incident Photosynthetically Active Radiation by refining our existing model which utilizes TOMS reflectivity data to account for cloud attenuation. In addition, we will extend the results of our algorithm development for application to the entire circumpolar boreal forest biome.

P.I.(s):	Markham, B.L., Holben, B.N./NASA/GSFC
Title:	Characterization of Atmospheric Optical Properties for BOREAS
Objectives and Approach:	We propose to characterize the physical and optical properties of the atmospheric aerosol and the atmospheric column abundances of water vapor and ozone over the BOREAS study area. a network of five fully automatic sunphotometers/radiometers will be established on a transect connecting the northern and southern BOREAS sites. These sites will provide year-round hourly direct solar and diffuse sky radiance measurements in the solar almucantar in the visible to near-infrared. During the intensive field campaigns the measurements will be supplemented by additional moveable stations and sampling of the aerosol particles. Aerosol physical properties of size distribution/concentration and composition, and aerosol optical properties of optical depth, phase function and albedo of single scattering will be determined. The annual cycle of the concentration and properties of the atmospheric aerosol particles in the Boreal region and the relation between the aerosol properties and the meteorological conditions, in particular the air trajectory and origin, will be assessed. The measured atmospheric properties will be used to validate retrieval algorithms of atmospheric parameters (e.g., water vapor, aerosol optical depths) from remotely sensed data. For selected remotely sensed data, atmospheric corrections will be performed using a radiative transfer code that accounts for the non- Lambertaian forest canopy reflectance. The retrieved reflectances will be compared to those measured at the surface and to those obtained using the atmospheric correction methodology used operationally by the BOREAS project.

Title:	Aerosol determinations and Atmospheric Correction for BOREAS Imagery
Objectives and Approach:	First, we propose to acquire Sun photometer data using ground-based instruments as well as using the Airborne Tracking Sun Photometer mounted on NASA's C-130 aircraft coincident with much of the remotely sensed data to be acquired for BOREAS; we will process this data to derive aerosol optical depths as a function of wavelength and make these data available as Core Measurements. Second, we propose to use the spectral aerosol optical depths to derive aerosol size distributions coincident with important BOREAS remote sensing data sets and use the size distributions to calculate aerosol optical properties such as phase functions and single scattering albedoes necessary for our atmospheric correction model. Third, we propose to incorporate a model of contribution of skylight into our atmospheric correction model to enable calculation of surface reflectances from our surface radiances. Fourth, we propose to extend our atmospheric correction model to data collected by the Advanced Solid-state Array Spectroradiometer (ASAS), incorporate an approximate Rayleigh multiple scattering correction, and provide a detailed evaluation of the results. Finally we will process the important remote sensing data sets for BOREAS from the Thematic Mapper (TM), the TM Simulator, System Probatoire de la Terre (SPOT), and ASAS. In sum, our proposed effort will provide critical atmospheric optical measurements and derive the aerosol optical properties necessary for atmospheric correction of BOREAS data, extend our atmospheric correction model, and provide atmospherically corrected data for BOREAS.

Title:	Helicopter-Based Measurements of Microwave Scattering Over the Boreal Forest
Objectives and Approach:	The objectives of the microwave measurement project are (1) to acquire the quantitative backscatter data required to understand better the physics of scattering from vegetative components and (2) to develop a neutral-network-based algorithm for estimating soil moisture and biomass of the boreal forest. The second objective is being supported by a GSRP fellowship from NASA-GSFC. Ultimately, we will develop a scattering model and model-based inversion algorithm to estimate soil moisture and biomass from satellite remote sensing data over the boreal forest, in particular by ERS-1, JERS-1 and SIR-C Synthethic-Aperture Radar (SAR). To accomplish these objectives, we will use a helicopter-based FM scatterometer operating at 10, 5.3 and 1.5 GHz with all four linear polarizations over incidence angles of 0° to 50°. This system will measure backscatter as a function of angle and frequency over the sites. Also, we will collect fine-resolution data at selected sites in an effort to determine the relative contributions of individual forest components to the total backscatter. All data will be reduced to backscatter coefficients using vector-correction techniques. After reducing the data, it will be used to train and test a feed-forward artificial

neutral netwock (ANN). The accuracy of the ANN will be evaluated using ground-truth data collected with help from Dr. jon Ranson and Dr. Roger Lang. Upon completion, we will provide data related to the interpretation of SAR data to other investigators via BORIS.

Title:	Quality Assurance of BOREAS Net Radiation Measurement
Objectives and Approach:	Because surface net radiation is generally a main determinant of how the hydrometeorological system operates and how the phenology of a canopy functions, it is a fundamental observable for BOREAS. this project is designed to ensure the highest possible accuracy and precision of the net radiation measurements taken throughout and between the BOREAS sites, and is further designed to help resolve past discrepancies in net radiation measurements based on engineering design and material properties differences in various makes of net radiometers. This project will also assess how well current geosynchronous satellite algorithms, based on 2-channel GOES VIS-IR radiance inputs, can retrieve surface net radiation at a hierarchy of space and time scales. The main deliverables of this project will be a time sequence of inter-calibrated and objectively analyzed gridded net radiation fields throughout the BOREAS IFCs, and a set of scientific papgers onL (1) the measured BOREAS surface net radiation field; (2) the radiometer inter-calibration issue and engineering design study; and (3) the measurement-satellite retrieval intercomparison study. The spatial resolution of the grids will be consistent with the separation distance between the radiometer sites; the time step will match that of the radiometer sampling time recommended by the BOREAS Science Team. All net radiation measurements incorporated in the objective analysis from the multiple sites will be inter-calibrated to an Eppley 4-way directional radiometer system, for which the calibrations of the directional devices would be traceable to the primary radiometers used in the field will be cross calibrated at a common site prior to the onset of the 1994 BOREAS summer field phase. All net radiometer stations at and between the northern and southern study areas will then be visited at least once in the course of the summer IFCs with a copy of the standard field model deployed on a portable data station to check on residual sensitivty differences. This radiometer will have

Title:	Distribution and Structure of Biomass in Boreal Forest Ecosystems
Objectives and Approach:	The overall objective of this research is to determine the amount and distribution of above ground biomass for ecologically distinct areas of the boreal forest. Specifically, we will 1) Improve and develop algorithms for mapping standing biomass in boreal forests; 2) Develop model inversion strategies for partitioning forest biomass into foliage, branch and bole components; 3) Determine the appropriate radar wavelength, resolution and incidence angle for detection of forest gaps, and to evaluate the ability of multifrequency polarimetric SAR data for extraction of information on forest spatial structure. To ensure success for the above objectives we will investigate the effects of forest structure, i.e., forest floor, understory, boles, branches and leaves on radar backscattering through field measurements, image data analysis, and backscatter modeling.

Title:	Estimation of Hydrological Parameters in Boreal Forest Using SAR Data
Objectives and Approach:	The objectives of this proposal are to evaluate the spatial and temporal variations of soil and vegetation characteristics in the boreal forest. The main focus of the following study will be on the application of multi-polarization, multi-frequency and multi-look angle SAR data to extract those parameters which have direct application in hydrology and boreal forest ecosystem models. Specifically, we intend
	(i) To acquire SAR images over a variety of soil and vegetation conditions during the intensive field campaigns of BOREAS. In particular, for the hydrology aspect of the experiment we will focus on successional stages, thawing and freezing cycles, snow cover and melting periods. In addition, we intend to process and calibrate all SAR images obtained during the field campaigns so that there will be a uniform data set available to investigators and to the BOREAS Information System (BORIS).
	(ii) To improve and implement a classification algorithm to identify various scattering mechanisms in SAR data, classify vegetation cover and species, and generate images or maps of clusters of various trees and gaps in boreal forest test sites.
	(iii) To develop and implement inversion algorithms for estimating vegetation characteristics such as water content of the top layer, and tree density and height. We will extend the applicability of the current physically based invertible forward model used in agricultural areas to forest canopies in order to correlate the above surface canopy water content with the type of species, density and height.

(iv) To estimate the surface characteristics such as soil moisture at various stages of freezing, thawing, snow, permafrost and dry conditions, surface roughness parameter, and digital elevation data. We will combine the inversion algorithm with the result of the classification program to identify open soil surfaces and double bounce scattering mechanisms to extract surface information. The accuracy of the SAR derived parameters will be verified with the *in situ* measurements.

v) To upscale the soil and vegetation characteristics derived from the SAR data to the scales needed for local, mesoscale, and regional hydrological modeling.

The main focus of this proposal will be the hydrological parameter estimation from SAR data by developing inversion algorithms with reasonable accuracy. To verify, develop, and test the algorithms proposed in this research we will make use of other remote sensing data such as passive microwave data and the visible/infrared imaging spectometer (AVIRIS) data for identifying surface features not visible in SAR images.

P.I.(s):	Way, J./Jet Propulsion Laboratory
Title:	Monitoring Environmental and Phenologic State and Duration of State with SAR as Input to Improved CO <sub>2</sub> Flux Models
Objectives and Approach:	We propose to monitor the environmental and phenologic state using AIRSAR and SIR-C/X-SAR data, and the duration of state with ERS-1 and RADARSAT data.
II	To quantitatively assess the importance of monitoring the environmental and phenologic state of the boreal forests, we propose to provide directly measured values of physiological state and duration of state to existing $CO_2$ models to asses the improvement in annual $CO_2$ flux estimates relative to measured values provided by BOREAS. In addition, the circumpolar boreal forest is divided into two classes: taiga and northern taiga for estimating total carbon uptake. We propose to provide regional maps of functional groups using SAR and winter optical (Landsat or SPOT) data.

Title:	Surface and Atmosphere Measurements and Radiative Transfer Modeling for the Calibration and Validation of the Airborne Visible-Infrared Imaging Spectrometer (AVIRIS) for Quantitative Data Analysis at BOREAS
Objectives and Approach:	Spectral and radiometric calibration of radiance-measuring sensors and for quantitative comparison of data acquired from different sites, times and instru- ments to meet calibration and validation requirements for AVIRIS during the BOREAS experiment. Ground based surface and atmospheric measurements with rigorously calibrated field instruments will be acquired simultaneously with the AVIRIS overflights. With assessments of surface and atmospheric characteristic derived from these ground based measurements a radiative transfer code will be used to predict the total radiance incident at AVIRIS. Analysis using this predicted radiance and the AVIRIS reported radiance will allow validation and calibration of the in-flight spectral and radiometric properties of AVIRIS. Rigorous error analysis of the field measurements, derived parameters, radiative transfer models and sensor characteristics will be implemented to constrain fully the results of this experiment.

P.I.(s):	Miller, J.R./York University
Title:	Variation in Radiometric Properties of the Boreal Forest Landscape as a Function of the Ecosystem Dynamics
Objectives and Approach:	Data collection is proposed with a Compact Airborne Spectrographic Imager (CASI) in the February to September 1994 period, at all 5 intensive and focused field campaigns. The CASI is being fitted with a calibrated downwelling irradiance fiber-optic link permitting direct acquisition of scene reflectances (also allowing under-cloud image acquisition) to generate a full seasonal database of temporal change in the spatial distribution of landscape components and the corresponding spectral reflectance changes in the boreal forest landscape. This dataset of high spectral/spatial resolution reflectance observations will provide a measure of the boreal forest ecosystem dynamics through changes in the physical parameters that describe the BOREAS landscape components [including overstory vegetation and understory moss/lichens or snow, water (bogs, ponds and lakes)]. The airborne data collections are intended to contribute to collaborative projects with other BOREAS co-investigators and collaborators. Analysis of these high spatial/spectral reflectance changes prior to and during snow melt to physical snow properties, (ii) the relationship to trace gas emissions and aquatic dissolved organic carbon content, (iii) the role of understory components and phenologic change in overall canopy reflectance for open canopies, and (iv) the seasonal/temporal variation in closed canopy reflectance as a function of (a) phenologic development of foliar components, (b) canopy architecture, (c) species composition, (d) canopy biophysical parameters of LAI and biomass, (e) foliar chemistry.

To address the question of scaling results from a site-specific level to a broader boreal region using remote sensing, we will examine: (i) seasonal change in reflectance/parameter gradients along a 500 km transect between the primary sites, (ii) remote sensing methods to relate high altitude radiance information to reflectance of landscape components, and (iii) methods for classification of the boreal region on a forest ecosystem/landscape unit basis.

Title:	Estimation of Photosynthetic Capacity using Polder Polarization
Objectives and Approach	The overall hypothesis of this proposal is that the ecosystem-dependent variability in the various vegetation indices is in part attributable to the effects of specular reflection. The polarization channels on the French sensor POLDER provide the potential to estimate this specularly reflected light and allow the modification of the vegetation indices to better measure the photosynthetic process in plant canopies. In addition these polarization channels potentially provide additional ecologically important information about the plant canopy. The expected result from this research is a series of map products providing seasonal estimates of 'minus specular' vegetation indices for flightlines at the two BOREAS test sites.

This is a companion effort to TF-6.

# **Appendix O: Satellite Overpass Schedule**

The data from the Landsat-5, NOAA-9, and NOAA-11 overpasses listed on the pages of this appendix WILL BE ACQUIRED by CCRS. Subsequent processing and inclusion of these scenes into BORIS and their availability to BOREAS investigators will depend on prevailing cloud cover conditions.

At the time of printing this document, a firm plan for acquiring actual SPOT data has not been reached. The SPOT overpasses listed on the pages of this appendix include all those scenes that could occur. The information about actual SPOT acquisitions will be updated and distributed at a later date.

MAS - MODIS (Moderate Resolution Imaging Spectrometer) Airborne		
	MAS - MODIS	(Moderate Resolution Imaging Spectrometer) Airborne

	Simulator
МКО	Manitoba Keewatinowi Okimakanak, Inc.
MM	Mission Manager
MODIS	Moderate Resolution Imaging Spectrometer
Ν	Nitrogen
NEP	Net ecosystem productivity
NIR	Near-infrared
NMC	National Meteorological Center
NOAA	National Oceanographic and Atmospheric Administration
NPP	Net primary production
NRC	National Research Council (Canada)
NS001 TMS	NS001 Thematic Mapper Simulator
NDVI	Normalized Difference Vegetation Index
PAR	Photosynthetically Active Radiation
PARABOLA	Portable Aparatus for Rapid Acquisition of Bidirectional
	Observations of Land and Atmosphere
PEM	Production Efficiency Model
PIR	Precision Infrared Radiometer
PSP	Precision Spectral Pyranometer
RASS	Radio Acoustic Sounding System
RSS	Remote Sensing Science
SAHQ	Site Area Headquarters
SAM	Site Area Manager
SAR	Synthetic Aperature Radar
SIR-C	Shuttle Imaging Radir
SOM	Soil Organic Matter
SPOT	Systeme Probatoire pour l'Observation de la Terre
TE	Terrestrial Ecology
TF	Tower Flux
TGB	Trace Gas
VAX	Virtual Address Extension (minicomputer tradename)
VIS	Visible
WAB	Wind-aligned blob; analogous to footprint
WCRP	World Climate Research Program
WMO	World Meteorological Organization
WUE	Water Use Efficiency
WX	Weather (implies bad weather i.e. scrub)
